WILDER HALL (DECEMBER, 1905.)

Commonwealth of Massachusetts.

MASSACHUSETTS AGRICULTURAL COLLEGE, AMHERST, Jan. 2, 1906.

To His Excellency WILLIAM L. DOUGLAS.

Sir: — I have the honor to transmit herewith, to Your Excellency and the Honorable Council, the forty-third annual report of the trustees of the Massachusetts Agricultural College.

I am, very respectfully, your obedient servant,

WM. P. BROOKS,

Acting President.

CALENDAR FOR 1906-1907.

Jan. 3, 1906, Wednesday, fall semester resumed, at 8 A.M. February 7, Wednesday, fall semester ends. February 8, Thursday, spring semester begins, at 8 A.M. March 28, Wednesday, spring recess. April 3, Tuesday, April 3, Tuesday, spring semester resumed, at 8 A.M. June 16, Saturday, Grinnell prize examination of the senior class in agriculture. June 17, Sunday, Baccalaureate sermon. June 18, Monday, Surnham prize speaking. Flint prize oratorical contest. June 19, Tuesday, Class-day exercises.

Meeting of the alumni.

Reception by the president and trustees. June 20, Wednesday, commencement exercises. June 21, 22, Thursday and Friday, examinations for admission, at 9 A.M., Botanic Museum, Amherst; at Jacob Sleeper Hall, Boston University, 12 Somerset Street, Boston; at Pittsfield; and at Horticultural Hall, Worcester. September 18, 19, Tuesday and Wednesday, examinations for admission, at 9 A.M., Botanic Museum. September 20, Thursday, fall semester begins, at 8 A.M. December 19, Wednesday, winter recess. Jan. 2, 1907, Wednesday, January 2, Wednesday, fall semester resumed, at 8 A.M. February 6, Wednesday, fall semester ends. February 7, Thursday, spring semester begins, at 8 A.M. March 27, Wednesday, spring recess. April 3, Wednesday, April 3, Wednesday, spring semester resumed, at 8 A.M.

June 19, Wednesday, commencement exercises.

ANNUAL REPORT OF THE TRUSTEES

OF THE

MASSACHUSETTS AGRICULTURAL COLLEGE.

His Excellency the Governor and the Honorable Council.

In beginning the preparation of the annual report, the mind irresistibly recalls the one who prepared the last. Even then suffering intensely, that dauntless soul, with courage and determination which were the surprise and admiration of all, with devotion to duty so absolute that self seemed to be entirely forgotten, still guided and impelled until the immediate, and therefore to him imperative, task was done. Then, and only then, could he be brought to relinquish the helm, to seek rest and hoped-for restoration to health. Again, as we write, comes vividly to mind that April morning when the telegraph and the telephone brought the sad news of his death. By that death on April 23, 1905, was brought to an end a period of almost thirty-eight years of most devoted service to this college.

Henry Hill Goodell, at that time twenty-eight years of age, and with an honorable and enviable record as college student, soldier and teacher, entered the service of the Massachusetts Agricultural College with its first class in the fall of 1867. Originally engaged as professor of modern languages and English literature, Mr. Goodell, during the formative period of the college, when its resources were small, and again when in the late seventies and early eighties the institution passed through its darkest days and its need was great, seems to have stepped into every breach where service was called for; and he filled at different times the position of instructor in such varied branches as gymnastics, military tactics, entomology, zoölogy, anatomy and physiology, rhetoric, elocution and his-

tory. The most striking tribute to the qualities of the man as an educator is found in the fact that in all this wide range of subjects he was an able, inspiring and most highly successful teacher. As a teacher I believe he will be longest remembered. Who that has sat under him as a pupil can ever forget his energy, his enthusiasm for his subject, his absolute mastery of the matter in hand, his hearty and appreciative recognition of good work, - nay, even of faithful effort unaccompanied with marked success, his quick perception of anything which even suggested an attempt to deceive, and the consequent instantly flashing scorn? under Mr. Goodell felt that he must do good work, and became imbued with a most earnest desire to win a word of appreciation from the teacher whom he so ardently admired. Who shall attempt to define the limits of the influence of such a teacher?

In connection with all his teaching and administrative duties, this professor and president found time for the duties of secretary of the faculty from 1882 to 1886, and served as librarian from 1885 to 1899. In a very real sense he was the creator of the library, which numbered but a few hundred volumes when he began his work, and had grown into one of the most complete of its class at the time of his death, when it numbered rather over 26,000 volumes.

On the death of President Paul A. Chadbourne, in 1883, Professor Goodell was made acting president, and served from February to September of that year. In 1886 he was elected president, and in 1888 director of the Hatch Experi-President Goodell brought to the discharge ment Station. of the duties of president and director executive abilities of a high order; and, as was to be expected of a man of his ability, singleness of purpose, energy and devotion to duty, his work was attended with distinguished success. the years of his presidency of the college, 1886 to 1905, the faculty of the institution was doubled, the students in attendance increased in about the same proportion, and the appropriations for the support of the college, both by State and national governments, were more than doubled. Indeed, in 1886 the State made no fixed annual appropriation for

the support of the college; at the time of President Goodell's death such appropriations totalled \$40,000 annually.

President Goodell early took a leading position in the Association of American Agricultural Colleges and Experiment Stations, in the organization of which he was one of the most For many years he was the chairman of its executive committee, in which position, as always wherever placed, he won in remarkable degree the admiration, love and respect of his associates. During the formative period of this association he played a most important part in shaping its organization and its policy, and in influencing national legislation. During these years the Hatch act and the second Morrill act were passed. The first established and provided for the support of one agricultural experiment station in each State and Territory in the Union, and the second appropriated to each agricultural and mechanical college the sum of \$25,000 annually. These acts have had the most far-reaching consequences for good. In pressing them upon the attention of congress and securing their consideration there, President Goodell, by his tact, energy and enthusiasm, was able to exercise great influence.

Any reference to the life of Professor and President Goodell, — "Prof. Henry" and "Prexy," as the boys liked to call him, — which should fail to call attention to his personal character and influence, would be incomplete and inadequate. The students felt always that in him they had a friend and sympathizer and a safe and wise counsellor; and the beauty of his life, reflected it may be indeed but faintly, will live in the lives and characters of his students.

Another of the very early instructors at the college has died during the year. Maj. Henry E. Alvord, who served his country in the volunteer forces engaged in the civil war with distinction, was the first military instructor in the Massachusetts Agricultural College. Coming to the college in that capacity in 1869, Major Alvord organized the military department and brought it to a high state of efficiency, relinquishing the position when he resigned from the army in 1871, after two years of service.

It was at about this time that Major Alvord, apparently

from pure love of the subject, took up the study of dairying, in which within a few years he became a recognized authority. He was later for some years at the head of the experimental farm belonging to the late Lawson W. Valentine of New York. On the retirement of Dr. Manley Miles from the chair of agriculture, in 1886, Major Alvord was elected to succeed him, but, receiving an offer of the directorship of the Maryland Agricultural Experiment Station, he resigned to accept that position early in 1888. It will be remembered that Major Alvord a few years later became chief of the Dairy Bureau of the United States Department of Agriculture, which position he filled with marked success until his It is a pleasure here to record the fact that Major Alvord always retained his interest in and love for the Massachusetts Agricultural College, as shown by the fact, elsewhere recorded in this report, that he made it a beneficiary under his will.

Courses of Study.

During the past year there has been but one change in the courses of study offered by the college, — the two-years course in horticulture for women has been withdrawn. cipal reasons for its withdrawal are the facts: First, that it does not seem to be in demand; during the four years that it has been offered, it has been taken by only two students. Second, it is well-nigh impossible for the college, with its present resources, to carry on the course. Third, it has not been found satisfactory by those students who have taken it. The time devoted to it is evidently too short for a thorough course, which alone is likely to satisfy. This change in no way affects the attitude of the college towards co-education. Women will still be welcomed for all regular courses, and a course in horticulture for women will be given whenever Simmons College, with which we have an agreement in relation thereto, is ready to send up a class.

A minor change in the conditions under which graduate study for the degree of Master of Science may be carried on should be noted. Graduates of our own college or of other approved institutions employed in the college or experiment station may in connection with the work for which they are employed pursue graduate studies for the degree, and any work done in discharging the regular duties of the position held which has a recognized value in fitting the man for the degree may be counted as a part of the work for the degree.

CHANGES IN FACULTY.

The past year has brought a number of changes in the teaching staff of the college. The illness of President Goodell during the early part of the year and his subsequent death made it necessary to provide for teaching history to the freshman class, which President Goodell himself had always done. This work was taken for the balance of the year by Maj. John Anderson. The resignation of Major Anderson taking effect the first of September, the college was fortunate in completing arrangements with Professor Gallinger, associate professor of history in Amherst College, for taking charge of the work during the present college year. Professor Gallinger is a graduate of Amherst College, and received a doctor's degree in Germany for post-graduate work in history. He is notably successful in his work as a teacher.

The resignation of Maj. John Anderson, who had acceptably filled the chair of professor of military science and tactics for five and a half years, to take effect the first of September, was received in June. This early notice gave ample opportunity to look up the qualifications of candidates for the position, and the place has been acceptably filled by the detail of Capt. George C. Martin, Eighteenth Infantry, who reported for duty early in September.

Dr. Charles S. Walker, who, in addition to serving as college chaplain, has for nineteen years filled the chair of political science, has been granted a year's leave of absence, dating from July 1 last. His work in the department of political science has been taken by George N. Holcomb, A.B., a graduate of Trinity College, who has had the advantage of two years' post-graduate work in American constitutional and political history and in economic and industrial history in the University of Pennsylvania and in Harvard University. Mr. Holcomb has also had successful experience as a teacher.

Mr. Henry J. Franklin, who during the past year served

as instructor in botany, resigned the first of July to continue post-graduate studies. His place was filled by the appointment of A. Vincent Osmun, M.S. Mr. Osmun is a graduate of the Massachusetts Agricultural College, from which institution in June last he also took the Master's degree. The unexpectedly large size of the freshman class rendered it impossible for Mr. Osmun to do all the work required, and he is now assisted by Mr. Franklin, who gives up a part of the time which he proposed to devote to his graduate work.

The introduction of laboratory work in the department of agriculture rendered the employment of additional assistance necessary; and Sidney B. Haskell, a graduate of the college in 1904, has been appointed instructor in agriculture. The resignation of William E. Tottingham, instructor in chemistry, to accept a better position elsewhere, made necessary the appointment of an instructor in chemistry; and Charles G. Barnum, A.B., a graduate of Middlebury College, Vt., has been appointed.

George O. Greene, who for two years had served as instructor in horticulture, resigned during the summer vacation to accept a position in Kansas, and his place has been filled by the appointment of Maurice A. Blake, a graduate of the college in the class of 1904, who during his first year out of college served acceptably as an instructor in the Rhode Island College of Agriculture and Mechanic Arts.

THE YEAR.

On the night of November 16 the large college barn and the dairy school wing attached thereto, with the greater part of the contents, were destroyed by fire, which seems without doubt to have been incendiary in its origin. The fire was not discovered until it had made great headway, and in spite of the courageous, cool and level-headed work of the farm superintendent and a large number of students, there was some loss of live stock. Seventy of the most valuable cows were saved, but a number of young cattle, two or three valuable cows which were in box stalls, and the bulls, were lost. The sheep, with the exception of the buck at the head of the flock, were saved; but the swine, kept in the basement,

with the exception of two or three animals, were destroyed. Fortunately the greater part of the breeding swine was in outlying buildings, which were not endangered by the fire. The barn contained a very large quantity of hay, roots, beets, celery and a great deal of farm machinery; no part of these could be saved. The dairy wing of the building was the last to burn, and a few of the valuable machines which it contained were safely taken out.

As the stock of forage depended upon to feed the cattle, with the exception of the silage, was destroyed by fire, it was deemed best to sell most of the animals. These were disposed of at public auction, and brought good prices. Sixteen of the best cows were saved, and these are temporarily accommodated in one of the barns of the Hatch Experiment Station. The sheep which were retained are also temporarily accommodated in one of the buildings of the experiment station.

The year just passed, in spite of the great losses which have been referred to, must be characterized as one of prosperity and growth. The college has admitted to its present freshman class the largest number ever enrolled in an entering class, — 86. The sophomore class, now numbering 61 men, is also, it is believed, the largest sophomore class in our history. The total enrollment in the regular four-year courses at the present time is 213 men, and we have 8 post-graduate students. We have, therefore, a larger number of men in college at the present time taking regular and post-graduate courses than ever before in its history.

The short course in dairy farming offered last winter was successful. Forty-one men were admitted to the class, and about one-half as many more were refused admission, as it was impossible to suitably provide for practical work for a larger number. The short course in bee farming which has been offered for the past two years did not fill; but the work was offered to members of the senior class, and was taken by 9 of these men, which is about as large a number as under present arrangements can be provided for. It is believed that the policy of offering this work to the members of the senior class should be continued.

Prizes.

A number of new prizes have been offered during the past year.

The Western Alumni Association at their last annual banquet in February voted to offer for three years an annual prize of \$25, to be awarded at the end of each college year to that member of the sophomore class who during his two years in college has shown greatest improvement in scholarship, character and example. This prize was awarded for the first time in June last. The offer of this prize is peculiarly welcome, not by any means solely because of its probable direct influence upon the men in college during their first two years here, though this is important, but rather because such an offer from a body of alumni makes evident to our students in a practical way the fact that men who have been here as students and who have gone out in the world are still interested in their Alma Mater; that they think of it with interest, and are willing to make sacrifices for its welfare. Such an offer, therefore, is likely to add enormously to the esprit de corps and enthusiasm of the whole student body.

The Bay State Agricultural Society at its last annual meeting voted to offer for one year a prize in forestry, to be known as the J. D. W. French prize, in honor of the late J. D. W. French, a former trustee of the college, and one of the very foremost in New England to work in the cause of improved forestry management. The amount of this prize is \$25, and it is to be awarded to that member of the senior class submitting the best essay on forestry.

An anonymous friend offers two prizes of \$15 and \$10, open to competition by members of the senior and junior classes. The basis of the award is to be an essay on the management of a farm wood lot.

Another gift to the college which should be mentioned in this connection is the bequest of the late Maj. H. E. Alvord, whose services to the college have been elsewhere referred to. Major Alvord's will left to the college the greater part of his books, pamphlets, periodicals and museum material, the whole constituting an exceedingly valuable collection. Major Alvord's will also bequeathed to the college the sum of \$5,000 (to become available upon the death of Mrs. Alvord), to constitute a fund to promote advanced study of problems connected with dairying.

Endowed Labor Fund.

In this connection attention is called to the fact, not heretofore publicly announced, that a generous friend of the college some five years since placed at its disposal as a fund for the assistance of needy and deserving students the sum of \$5,000. This friend modestly desires that his name shall not be published. The sum of money thus donated has been invested, and the income will be used to pay for the labor of deserving students needing the opportunity for selfhelp.

The improvements provided for by the last Legislature have all of them been entirely completed or well advanced toward completion. The addition to the entomological laboratory and the construction of a new plant house for the entomological department have been completed within the appropriation, and both are eminently satisfactory. The central heating system has been extended in accordance with plans to the new horticultural building, to the botanic museum and to the east experiment station building. has been very thoroughly done under the direct charge of the college engineer within the appropriation, and it is believed the new lines will prove more thoroughly insulated and more satisfactory in every way than any portion of the lines previously put in. The large barn and the dairy school wing, recently destroyed by fire, and the horse stable, had been put into thorough repair and well painted, at an expense leaving a balance of about \$92 of the appropriation made for these The new horticultural building is completed with the exception of the finish. A view of the building, which by vote of the trustees will be called Wilder Hall in honor of the late Marshall P. Wilder, as it stood December 1 constitutes the frontispiece in this report, and a description of it, with floor plans furnished by Professor Waugh, follows: -

HORTICULTURAL BUILDING.

The General Court of 1905 appropriated the sum of \$39,950 "to build, furnish and equip" a building for the department of borticulture and landscape gardening at the Massachusetts Agricultural College. This building is now nearly completed, and

will doubtless be finished during January, 1906. It was designed by Mr. W. R. B. Willcox, a successful architect of public buildings. It was built by Blodgett and Bosworth of Amherst.

The building is approximately 50 by 70 feet in size, and has three floors, the entire floor space being available. The construction is practically fireproof, being of red brick, trimmed with terra

cotta, floored with fireproof tile and roofed with tile. It is heated by steam furnished by the central heating plant of the college.

The basement floor contains two class rooms, two laboratories, a storeroom, instrument room, lavatory, etc. The first floor con-

tains two offices, records room, library, museum and a large student laboratory. The second floor contains a large drafting room for landscape gardening, a class room, two laboratories, and a living room for the care taker. The building will accommodate the recitations, lectures and laboratory work in horticulture, floriculture, landscape gardening and forestry.

NEEDS OF THE COLLEGE.

It will be remembered that we asked the Legislature last year for an appropriation for what would have constituted practically a new building for the botanical department, but that this appropriation was not granted. The loss of the dairy rooms and the increasing numbers in the college make the pressure for additional rooms yet greater than it was last year, and this will be true even after the completion of the horticultural building. The large size of the freshman class made necessary its division into three sections for laboratory work in botany. It has been found a matter of much difficulty to schedule the work on this basis. We found it impossible to provide for it, as is elsewhere pointed out, save through the appointment of an additional teacher; but the subdivision of the class into three sections for a part of its work and not for the work in other subjects creates much confusion; and, further, subdivision for other subjects, although it would be desirable from the standpoint of efficiency of the work, is not deemed practicable on account of the large increase in teaching force which would be necessary to provide for it. freshman class for most of the branches of its work is divided into two sections, but even such subdivision is impossible in all subjects; and the only room in the college sufficiently large to provide for meeting the entire class, as is desirable for certain lectures, is the main audience room in the college chapel. This room is very ill suited to work of this description, as it is far too large and too high. Moreover, it is impossible to use this room, with such furniture as is appropriate to its use as a chapel, for making the demonstrations which should accompany lectures in certain scientific subjects.

The sophomore class also is so large that it must be subdivided into two sections for work in a portion of its studies. Such subdivision is necessary to the attainment of satisfactory results, and, as will be at once seen, it necessarily greatly increases the work imposed upon our teaching force. It is imperative that the pressure upon the teaching force be reduced as far as possible; and it must, therefore, be regarded as a matter of the highest importance that rooms of sufficient

size to accommodate such a class for lectures, which can as well be given to the entire number as to a smaller number, should be provided at as early a day as possible. At the present time one of our instructors meets a class of 61 men in a room whose dimensions are 32 by 183/4 feet, — a room with no provision for ventilation except by means of the windows, and not well fitted for more than half the number of students now meeting in it. In another subject the same class meets in a room 24 by 27 feet, designed to accommodate only two-thirds the number. It is deemed important at this time to point out, further, that many of the other rooms which we are now using are quite unfit for the purposes to which they are put. They are located in buildings some of them put up forty years ago, and are altogether unworthy of the State of Massachusetts, and far below the standard maintained not alone in colleges and universities, but even in cities and towns of the State for educational purposes. Thus, for example, the city of Springfield has spent more money in the erection of two high school buildings than the State of Massachusetts has spent for all the buildings used for educational purposes in this institution. It is well known that to do good work along scientific lines requires ample provision of room and equipment; and the State should realize that in the near future a very considerable expenditure will be required to bring the equipment of this institution into a condition even reasonably satisfactory.

The college imperatively needs at the present time the following provisions for additional room for instructional purposes, and for doing the work for which it exists:—

1. A new building for the botanical department. The inconveniences under which this department now works have been set forth. We asked last year for a sum sufficient to enlarge an existing building and to provide equipment. The location of the existing building which it was proposed to enlarge is not such as to render it the most convenient for the uses to which it will be put, and since the amount saved by enlarging the old building rather than putting up an entirely new structure is relatively small, it has been thought best this year to ask for an entirely new building, located

near the new horticultural building and the insectary. This building is to include lecture rooms and laboratories of greatly increased size. The principal lecture room will accommodate 150 students; the principal laboratory will accommodate 60 students. The building provides smaller rooms and laboratories for advanced students and for the head of the department, and it provides further the needed quarters for the experimental work of the department. For this building and the plant house, which is a necessary part of it, we need the following amounts:—

For the main bu	ild	ing,									\$60,500
For the hothouse	,									٠.	5,500
For introduction	of	heat	from	the	centra	al he	ating	syste	em,		2,000
For equipment,											7,000
Total.											\$75,000

- 2. The college needs new greenhouses for the horticultural department. The hothouse products of the State have increased rapidly during the last few years, and have now attained a total annual valuation considerably in excess of \$2,000,000. The college aims to teach hothouse management as an industrial proposition. The only houses which it possesses are those built from twenty to forty years ago. The plan of construction is radically different from that of the present day, and it is a practical impossibility to teach modern industrial horticulture while using such houses. For new houses we need the sum of \$20,000.
- 3. The college last year asked the Legislature for an appropriation of \$5,000 for the installment of duplicate engine and generator for our lighting plant. With the growth of the institution the capacity of the present machinery is practically reached; further growth, which is sure to come, means that the machinery will be overtaxed. We have had several breakdowns, involving great inconvenience and interruption to the work of the college in the past; with the machinery taxed more heavily, such breakdowns will become increasingly probable. We imperatively need, and in the immediate future, a new generator and dynamo of increased capacity,

and for this purpose an appropriation of \$5,000 will be needed.

4. When last year in asking for a new horticultural building an item for maintenance was included, the representatives of the college were told that it was against the policy of the State to grant annual appropriations for maintenance in that way; that the State policy was that each institution should annually ask for such sums as should be actually necessary for maintenance of its various buildings and its property. With a view to carrying out this suggestion, a careful examination of the different buildings, roads, bridges, etc., belonging to the college has been made, and it has been found that the following amounts will be needed for maintenance during the next ensuing year:—

For slating t	he r	oof of	the	drill	hall	land	genera	ıl re	pairs	ther	eto,	\$6 50
For repairs a	and i	mprov	eme	ents i	n re	ads a	nd wa	lks	(tota	l len	gth	
about 4 mi												150
For repairing	gan	d paint	ing	the p	ores	ident	's hous	se,				350
For new wat												100
For repairs												
windows,												150
For repairs												
windows,										- ·		150
For installation of steam heating to replace worn-out furnace												
in farmho	use,											100
For repairs a												100
For steel-tru	ss fla	ag staf	ř,									350
For increase												
system,												1,000
For painting												
house, fert												400
For apparatu												1,000
Total,												\$4, 500

5. It was for many years the policy of the college to keep its buildings and property fully covered by insurance. The State some years since refused further appropriations to pay insurance premiums, on the ground that it is not the policy of the State to insure in private companies, but rather to run its own risks or insure its own property. The loss of the farm barns and dairy building and the greater part of their con-

tents has been referred to. The aggregate money loss allowed by the insurance companies on buildings and contents was \$55,408.38. There were in existence at the time of the fire a few blanket policies the term of which had not expired. these policies the college recovered the sum of \$17,229.39. this sum it has been found necessary, in order to meet the emergencies due to the fire, viz., to provide temporary accommodations for stock, to prepare and equip new rooms for instruction in dairying, and to purchase necessary farm implements and machines, to expend some \$5,000. It is deemed best, in rebuilding stables, dairy buildings and silos, to adopt fireproof construction. Because of this change in plan and the great increase in the cost of building during the last few years, it is found that we shall require \$63,000 in addition to the balance of insurance money to erect new barn, stables, piggery, silos and farm dairy building.

6. The horticultural building having now been completed, it is found necessary to ask for the appropriation of \$1,000 annually for maintenance thereof.

Briefly summarizing our needs, we require for: —

New building and plant house for the botanical department	ıt, .	\$75,000
New greenhouse for the horticultural department,		20,000
Duplicate engine and generator for lighting plant,		5,000
Maintenance,		4,500
Barn, stables, piggery, silos and farm dairy building, .		63,000
For maintenance of the horticultural building, annually,		1,000
Total,		\$ 168,500

Plans for the erection of new farm buildings are under consideration. Such buildings will be a necessity, and at an early date during this session it will be necessary for the college to appeal to the Legislature for such sum in addition to insurance money as may be required to put up new buildings, to install a new equipment of farm machinery and implements and to purchase new live stock.

The recommendations in the report of Captain Martin, herewith transmitted, are especially worthy of attention. What he has to say concerning the benefits which would follow an annual encampment and improved facilities for and meth-

ods of target practice are particularly commended to your attention. Equally important is his suggestion that an effort be made to secure modification of the rules now governing the War Department in the selection of the men to be recommended for appointment as second lieutenants in the regular army. Captain Martin's points appear to be well taken. It is believed that assigning to the agricultural colleges a certain proportion of the available appointments, to be competed for by these colleges alone, would do much to increase the interest in the military training in these institutions, and thus add greatly to its value for all.

THE STUDENT BODY.

The last annual report showed the towns and cities in the Commonwealth from which the students then in college came. It will be of interest to note the proportion coming respectively from cities and from rural communities. The total number of undergraduate students in college in December, 1905, was 213; of these, 24 came from other States in the Union and 5 from foreign countries. The total number of undergraduate students claiming residence in Massachusetts was 184; of these, 68 came from cities and 116 from towns. Nearly two-fifths of these students, therefore, come from cities. There are 33 cities in the Commonwealth; of these, 20 are represented in our student body. There are 320 towns in the Commonwealth; of these, only 69 are represented in the student body. It is apparent that the towns are not making use of the advantages offered by the college to the same extent as the cities. It must be recognized, however, in noting this fact, that the urban population is greater than the rural population, and the proportion of students to total rural population is greater than the proportion of students to total urban population.

In this connection it will be of interest to note the occupations followed by the parents of our students. A careful investigation to determine these occupations was made one year ago. The proportion of parents in the different occupations would doubtless be substantially the same at the present time. In December, 1904, there were 179 undergraduate students in the college; the occupations of the fathers were reported as follows:—

	Occup	ATIO	NS OF	FATHERS	S.			Number.	Per Cent.
Business (merch	ants,	dea	ilers,	etc.),				56	32.2
Lawyers,								4)	
Physicians.		•	•			:	•		
Physicians, Clergymen,	:		·					4	9.0
Other, .				•				8 j	
Government office	ials,							$2^{'}$	1.2
Farmers, .								60	34.0
Wage earners,								38	21.3
Farmers, . Wage earners, Retired, .								4	2.3
								176	
Unheard from,								5	_

These figures disclose the fact that only about one-third of our students come from the farm.

In this connection it is of interest to note the studies elected by the students during junior and senior years. There are in college at the present time 54 men in the two upper classes; of these, 38 have elected either agriculture, horticulture or landscape gardening. It will thus be seen that, with only one-third of our students coming from the farm, we have practically two-thirds of those in junior and senior years electing agriculture. An investigation recently made shows that 25 per cent. of the men graduated from the college in the last ten years are actually on the farm; about 35 per cent. more are engaged in occupations directly connected with agriculture, such, for example, as teaching in agricultural colleges and schools, agricultural chemistry, economic entomology and experiment station investigation.

These facts are a sufficient answer to the criticism sometimes heard, that the agricultural college turns students from the farm.

Respectfully submitted, by order of the trustees,

WM. P. BROOKS,

Acting President.

THE CORPORATION.

OBJECT.

The leading object of the Massachusetts Agricultural College is "to teach such branches of learning as are related to agriculture and the mechanic arts, . . . in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions in life." That this result may be secured by those for whom it is intended, the college invites the co-operation and patronage of all who are interested in the advanced education of the industrial classes in the Commonwealth.

The principles of agriculture are illustrated on the extended acres of the farm belonging to the college estate. Nature's work in botany and in horticulture is revealed to the eye of the student in the plant house and in the orchards accessible to all, while the mysteries of insect life, the diseases and the cure of domestic animals, the analysis of matter in its various forms, and the study of the earth itself, "the mother of us all," may engage the attention of the student during the years of his college course.

GRADUATE COURSES.

In response to the increasing demand for advanced work in various directions, the college has arranged for courses of study leading to the degrees of Master of Science and Doctor of Philosophy.

Honorary degrees are not conferred.

Applicants are not eligible to the degree of Master of Science or Doctor of Philosophy until they have received the degree of Bachelor of Science or its equivalent.

The fee for the degree of Master of Science is ten dollars and for the degree of Doctor of Philosophy twenty-five dollars, to be paid to the treasurer of the college before the degree is conferred.

Courses for the Degree of Master of Science.

A course of study is offered in each of the following subjects: mathematics and physics, chemistry, agriculture, botany, horticulture, entomology, veterinary medicine. Upon the satisfactory completion of any two of these, the applicant receives the degree of Master of Science.

Candidates for the degree of Master of Science must devote not less than one year and a half after graduation to the prosecution of two studies for the degree, one year of which must be in residence at the Massachusetts Agricultural College.

Courses for the Degree of Doctor of Philosophy.

The establishment of courses leading to this degree is the result of many calls for advanced study along certain economic lines neglected in most American universities, and is given only by those departments especially equipped for this grade of study, to graduates of this college or other colleges of good standing. The work required for the degree is intended to be so advanced in its character as to necessitate the greatest industry to complete it, with the belief that such severe requirements will result in the greatest credit to those who are successful. Four courses of study only are therefore open, viz., botany, chemistry, entomology and horticulture as major subjects, though a minor in zoölogy is also available.

At least three years are necessary to complete the work required; twenty hours per week to be devoted to the major subject, while from twelve to sixteen hours per week are required for each of the two minor subjects during one and a half years.

The work in the major and minors will necessarily differ with the previous training and needs of different students, but a general outline of the major in each subject is as follows:—

Botany. — Vegetable physiology, vegetable pathology, mycology, ecology, taxonomy, phylogeny, the history of botany, and the history and theory of evolution. The above subdivisions of botany will be, to a greater or less extent, pursued as necessitated by the previous training of the student and nature of the original problem undertaken. In this course it is also recommended that the student take, in addition to this prescribed minor work, a brief course in the history of philosophy and psychology, which at present will have to be provided elsewhere. Extensive reading of botanical literature, of both a general and specific nature, will be required in certain subjects, and occasional lectures will be given. A botanical conference is held monthly, wherein various new problems touching upon botanical science are considered by graduate students and those of the senior class electing botany. A thesis dealing with some economic problem in plant physiology or pathology, or both, and containing a distinct contribution to knowledge, will also be required.

Chemistry. — Advanced work in the following subjects: inorganic analysis, qualitative, of the rarer elements, and quantitative; crystallography; physical chemistry; descriptive and determinative mineralogy; chemical geology; soil formation; soil physics and chemistry; gas analysis; synthetic inorganic work; chemical theory and history; general organic chemistry; special topics in organic chemistry; elementary quantitative organic analysis; proximate qualitative and quantitative organic analysis, including determination of organic radicles; organic synthesis of aliphatic and aromatic compounds; problems in chemical manufacture; recent chemistry of plant nutrition; animal phy-

siological and pathological chemistry, including foods, standards for feeding of all kinds, and, among secretions, milk and milk industries; and, among excretions, urine and urinalysis; toxicology; insecticides and fungicides; frequent examinations on current chemical literature.

Early in the course original work on some chemical subject pertaining to agriculture must be begun. The history and results of this work must be submitted before graduation, in the form of a thesis containing a distinct contribution to knowledge.

Entomology. — General morphology of insects; embryology; life history and transformations; histology; phylogeny and relation to other arthropods; hermaphroditism; hybrids; parthenogenesis; pædogenesis; heterogamy; chemistry of colors in insects; luminosity; deformities of insects; variation; duration of life.

Ecology: dimorphism; polymorphism; warning coloration; mimicry; insect architecture; fertilization of plants by insects; instincts of insects; insect products of value to man; geographical distribution in the different faunal regions; methods of distribution; insect migrations; geological history of insects, insects as disseminators of disease; enemies of insects, vegetable and animal, including parasitism.

Economic entomology: general principles; insecticides; apparatus; special cases; photography of insects and their work; methods of drawing for illustrations; field work on insects, and study of life histories; insect legislation.

Systematic entomology: history of entomology, including classifications and the principles of classification; laws governing nomenclature; literature,—how to find and use it; indexing literature; number of insects in collections and existence (estimated); lives of prominent entomologists; methods of collecting, preparing, preserving and shipping insects; important collections of insects.

Journal club: assignments of the literature on the different groups of insects to different students, who report at monthly meetings summaries of all articles of value which have appeared during the month.

Required readings of the best articles on the various topics named above, and on the different orders of insects. This reading covers from 15,000 to 20,000 pages in English, French and German, and the candidate is examined on this, together with his other work, at the close of his course.

Thesis: a thesis with drawings, which shall consist of the results

of original investigations along one or several lines, and which shall constitute a distinct contribution to knowledge, must be completed and accepted before the final examinations are taken.

Horticulture. — The work in horticulture necessarily varies considerably with different candidates, since its most important features are specialization, original investigation, and the development of individual initiative in dealing with new questions. Each candidate must select some special field of horticultural study, and devote himself continuously to it. He will be required to attend lectures, conferences and seminars dealing with horticulture in its broader aspects. Advanced work will be required in the following subjects: systematic pomology, pomological practice, commercial pomology; systematic, practical and commercial olericulture; greenhouse plants and problems; floriculture; landscape gardening; plant breeding and general evolution; and questions of a physiological nature connected with propagation and pruning.

Other requirements and opportunities are: (1) periodical seminars with special lectures, by prominent men from outside the college; (2) extensive and systematically planned readings; (3) frequent visits to orchards, gardens, greenhouses, estates and libraries outside the college grounds, always with some definite purpose in view; (4) and, finally, the preparation and publication of a thesis setting forth the results of the candidate's major study, which shall be an original and positive contribution to

horticultural knowledge.

 $Zo\"{o}logy.$ — This course is offered as a minor subject for candidates for the degree of Doctor of Philosophy.

General and comparative anatomy, both gross and microscopic; ontogeny and phylogeny; life cycles, metamorphosis and metagenesis; animal associations, colonial, commensal and parasitic, and symbiotic associations of animals and plants; adaptation, adaptive radiation and parallelisms.

Geologic, geographic and bathymetric distribution of animals. Systematic zoölogy, including palæozoölogy; museum and field technique.

Economic zoölogy.

History and development of zoölogical science.

Weekly seminars and journal club meetings are held, in which all advanced students of zoölogy take an active part.

Collateral reading and a general knowledge of current zoölogical literature are required.

FOUR-YEARS COURSES.

Degree.

Those who complete the four-years course receive the degree of Bachelor of Science, the diploma being signed by the governor of Massachusetts, who is the president of the corporation.

Regular students of the college may also, on application, become members of Boston University, and upon graduation receive its diploma in addition to that of the college, thereby becoming entitled to all the privileges of its alumni, provided that the candidate, in addition to the college course, shall have mastered in a preparatory school a three-years preparatory course in studies beyond those commonly presented in the grammar schools of Massachusetts.

Admission.

Every candidate for admission must be at least sixteen years of age, and must present a testimonial of good character from the principal of the last school that he attended.

Certificates. — Certificates of schools and academies approved by the faculty of the college are accepted in place of examinations. These certificates must be made out on blanks furnished on application to the registrar, and must be signed by the principal of the school making such application.

A student admitted on certificate may be dropped from college at any time during freshman year when his work is not satisfactory; and the privilege implied in the acceptance of a certificate may be revoked whenever, in the judgment of the faculty, it is not properly exercised.

Examinations.— Candidates for admission to the freshman class will be received on certificate, as explained above, or on examination in the following subjects: algebra (through quadratics), plane geometry, English, general history, civil government (Mowry's "Studies in Civil Government"), physiology (Martin's "The Human Body," briefer course), physical geography (Guyot's "Physical Geography," or its equivalent).

This examination may be oral or written; the standard required for admission is 65 per cent. in each subject. Knowledge of the principles of arithmetic is presupposed, although an examination in this subject is not required. Teachers are urged to give their pupils such drill in algebra and geometry as shall secure accuracy and readiness in the application of principles to practical examples.

A candidate will not be accepted in English whose work is notably deficient in point of spelling, punctuation, idiom or division into paragraphs. The candidate will be required to present evidence of a general knowledge of the subject matter of the books named below, and to answer simple questions on the lives of their authors. The form of examination will usually be the writing of a paragraph or two on each of several topics to be chosen by the candidate from a considerable number — perhaps ten or fifteen — set before him in the examination paper. treatment of these topics is designed to test the candidate's power of clear and accurate expression, and will imply only a general knowledge of the substance of the books. The books set for the examination in 1906 are: Shakespeare's "The Merchant of Venice; "Goldsmith's "The Vicar of Wakefield; "Scott's "Ivanhoe;" Tennyson's "The Princess;" Lowell's "The Vision of Sir Launfal;" George Eliot's "Silas Marner." For the examination in 1907 and 1908 the books are: Shakespeare's "The Merchant of Venice; "Irving's "Life of Goldsmith;" Coleridge's "The Ancient Mariner;" Scott's "Ivanhoe" and "The Lady of the Lake; "Tennyson's "The Passing of Arthur;" Lowell's "The Vision of Sir Launfal;" George Eliot's "Silas Marner."

Examinations in one or more of the required subjects may be taken a year before the candidate expects to enter college, and credit for successful examination in any subject will stand for two years after the examination.

Candidates for classes more advanced than the freshman class will be examined in the studies gone over by the class to which they desire admission.

The examinations for admission in 1906 will be held at the Botanic Museum of the Agricultural College in Amherst on Thursday and Friday, June 21 and 22, and on Tuesday and Wednesday, September 18 and 19, as follows:—

First Day.	Second Day.
8.30 A.M. — Registration.	9 A.M. — Civil government.
9 A.M. — English.	10 A.M. — Algebra.
11 A.M. — General history.	2 P M. — Physiology.
2 P.M. — Geometry.	3 P.M. — Physical geography.

Entrance examinations in June will be held on the same days and in the same order as in Amherst: at Jacob Sleeper Hall, Boston University, 12 Somerset Street, Boston; at Horticultural Hall, Worcester; and at Pittsfield, but candidates may be examined and admitted at the convenience of the examiners, at other times in the year, but not during the summer vacation.

ENTRANCE EXAMINATION PAPERS USED IN 1905.

The standard required is 65 per cent. on each paper.

ALGEBRA.

- 1. Factor $\frac{a^2}{b^2} + \frac{b^2}{a^2} 2$. Factor $6x^2 - 7xy - 3y^2$.
- 2. Expand by binomial theorem $(a^{1/2} + 2b^2 x^{-1})^4$.
- 3. Find the square root of $x^4 x^3 + \frac{x^2}{4} + 4x 2 + \frac{4}{x^2}$.
- 4. Find sum of $\sqrt{\frac{3}{4}} + \sqrt{\frac{1}{3} + \frac{1}{6}} \sqrt[4]{9}$.

5. Solve
$$\frac{ax-1}{\sqrt{ax+1}} = 4 + \frac{\sqrt{ax-1}}{2}$$
.

6. Solve
$$\begin{cases} \frac{a^2}{x^2} + \frac{b^2}{y^2} = 10. \\ \frac{ab}{xy} = 3. \end{cases}$$

7. Solve
$$\begin{cases} x^2 + y^2 + x + y = 32. \\ xy = 12. \end{cases}$$
Solve
$$\begin{cases} x^2 + xy = 15. \\ xy - y^2 = 2. \end{cases}$$

GEOMETRY.

- 1. (a) What is a scalene triangle? (b) What is an inscribed angle? (c) What is a segment of a circle? (d) Give theorem of limits. (e) What is a sector of a circle?
- 2. Find the area of a segment of a circle having for its chord a side of a regular inscribed hexagon, if the radius of the circle is 10; take $\pi = 3.1416$.
- 3. The medians of a triangle intersect at a common point, which lies two-thirds the way from each vertex to the middle point of the opposite side. Prove.
- 4. Draw the exterior and interior common tangents to two given circles which do not intersect. Explain constructions fully.
 - 5. Find the area of a triangle whose sides are 8, 13, and 15.

PHYSICAL GEOGRAPHY.

- 1. Describe the continent of South America, its form, boundaries, elevation, drainage, and the relation of the mountain systems to the continent form.
- 2. What is glacial erosion? What evidence have we of the former existence of an ice sheet in this region? What is an esker? A drumlin? A terminal moraine?
- 3. What are corals? Under what conditions do they live? What is a barrier reef? A fringing reef? An atoll? How is each formed?
- 4. What are ocean currents? Describe and explain the gulf stream. What is its influence on mankind? What is the Sargasso Sea? Where is it?
- 5. Describe the physical features and climate of Massachusetts (or your home State). What influence do these have on its agriculture, manufactures and other industries?

CIVIL GOVERNMENT.

- 1. Name the characteristic features of the following forms of government in this country:—
 - (a) Provincial.
 - (b) Proprietary.
 - (c) Charter.
 - (d) Revolutionary, 1776-1781.
 - (e) Confederate, 1781–1789.
 - (f) Constitutional, 1789–1905.
- 2. Give the year, month and day of the month when the United States began its existence as a nation. What act signalized this beginning?
- 3. State three qualifications for the office of President of the United States. Name the vice-presidents who have succeeded to the presidency by the death of the president.
- 4. Name the principal courts of the United States. Give five kinds of cases that can be brought before the United States courts.
- 5. Write upon the following subjects, developing them as fully as you can:—
 - (a) The Massachusetts Legislature.
 - (b) Municipal government.
 - (c) The regulation of railroad rates.

Physiology.

- 1. Compare carefully the skeleton of the arm and leg with the hip and shoulder girdle, naming and describing the corresponding bones in each, and giving their positions.
- 2. Describe the digestive system, and tell of each process and where it occurs in the digestion of a meal consisting of beefsteak, potatoes, and bread and butter.
- 3. Describe carefully the process of respiration. How the air is inhaled. How it is exhaled. What changes have occurred in the air thus breathed? What in the blood?
- 4. What is the difference between a cold and a warm blooded animal? How is the temperature kept up in the latter? Are there any waste products arising from this production of heat? If so, what becomes of them?
- 5. What is a nervous impulse? What is reflex action? Give an example of the latter, explaining in full.

GENERAL HISTORY.

- 1–4. Write a general account of the old civilization of the following three countries, Egypt, Greece and Rome, discussing: (a) classes of people in each; (b) occupations of the common people; (c) art, as shown in buildings, statuary and literature; (d) war-like characteristics.
- 5. What is meant by "The fall of the Roman Empire," which took place in 476 A.D., and why is this date considered the dividing line between ancient and mediæval history?
- 6. What was the effect of the spread of Christianity over the northern countries of Europe? What were some of the actual results of this, so far as the following are concerned? (a) Buildings; (b) Crusading; (c) Literary work.
- 7. Name the events in connection with the history of England that were directly instrumental in laying the foundations of the present English language.
- 8. What was the great service rendered to their country and to their subjects by the following rulers? (a) Charlemagne; (b) Peter the Great; (c) Frederick the Great; (d) Cromwell.
- 9. Name four different events in the history of our own country which you think had a great influence on the history of the nineteenth century.
- 10. What was the age of compromise in the history of the United States? In what way did this "age" really bring on the civil war?

ENGLISH.

 ${\tt Nore.-Penmanship}, \ {\tt punctuation} \ {\tt and} \ {\tt spelling} \ {\tt are} \ {\tt considered} \ {\tt in} \ {\tt marking} \ {\tt this} \ {\tt paper.} \ {\tt The} \ {\tt time} \ {\tt allowed} \ {\tt is} \ {\tt two} \ {\tt hours}.$

- 1. Choose two of the following topics, and write clearly and interestingly upon them. Let each essay be about three hundred words in length.
 - (a) Shakespeare's first acquaintance with the theatre.
 - (b) The bright and the dark side of Oliver Goldsmith.
 - (c) Walter Scott's fight against bankruptcy.
 - (d) Lowell's boyhood and college days.
 - (e) Tennyson's love for retirement.
 - (f) The life of George Eliot.
- 2. Choose any three of the following, and write a few paragraphs on each subject chosen. Give title in each case.
 - (a) Was Shylock's demand for justice unreasonable?
 - (b) Home life as depicted in the "Vicar of Wakefield."
 - (c) What we learn of Robin Hood from "Ivanhoe."
 - (d) The abiding lesson of Tennyson's "Princess."
 - (e) Sir Launfal before and after the "Vision."
 - (f) The two brothers in "Silas Marner."

COURSES OF INSTRUCTION FOR THE DEGREE OF BACHELOR OF SCIENCE.

AGRICULTURE.

Introductory: relations of federal and State governments to agriculture, four lectures; history of agriculture, tenure of land, rents, holdings, etc., six lectures.

Freshman year, first semester, three hours a week, required. Animal breeding. Shaw's "Breeding Animals," lectures and discussion of principles of breeding. — Assistant Professor Cooley.

Sophomore year, seven weeks, first semester, four exercises a week in class room, required. Breeds of farm live stock: sheep, cattle. Lecture syllabus by Cooley, and Curtis's "Horses, Cattle, Sheep and Swine." — Assistant Professor Cooley.

Sophomore year, nine weeks, first semester, four exercises a week in class room, required. Horses and swine. Lecture syllabus by Cooley, and Curtis's "Horses, Cattle, Sheep and Swine."

— Assistant Professor Cooley.

Sophomore year, eight weeks, second semester, three hours a week, required. Dairying. Lectures on dairy farming, milk production, handling and marketing of milk, milk preservation and modification, and products of milk. Text-book, Wing's "Milk and its Products."—Assistant Professor Cooley.

Sophomore year, ten weeks, second semester, required. Soils: formation, classification, composition; physical and chemical characteristics, and their relations to maintenance and increase in productiveness. Brooks's "Agriculture," Vol. I., supplemented by lectures and laboratory work. — Professor Brooks.

Junior year, ten weeks, first semester, elective. Methods of soil improvement, including tillage, drainage and irrigation. Brooks's "Agriculture," Vol. I., supplemented by lectures, laboratory work and practical exercises. — Professor Brooks.

Junior year, four weeks, first semester, elective. Manures: production, composition, properties, adaptation and use. Brooks's "Agriculture," Vol. II., supplemented by lectures and practical exercises. — Professor Brooks.

Junior year, four weeks, first semester, elective. Stock judging. — Assistant Professor Cooley.

Junior year, second semester, elective. Fertilizers, including a critical study of their production, composition, properties, adaptation and use; and green manuring. Brooks's "Agriculture," Vol. II., supplemented by lectures, laboratory work and practical exercises. — Professor Brooks.

Senior year, four weeks, first semester, four hours a week, elective. Silos and ensilage: historical development; the merits and methods of construction of the different kinds of silos; the crops suited for ensilage; ensilage machinery; the methods of filling the silo; and the nature and extent of the changes taking place in ensilage as affecting food value. Lectures, books of reference and practical exercises. — Professor Brooks.

Senior year, seven weeks, first semester, four hours a week, elective. Feeding animals: principles of digestion and animal nutrition, a study of feeding stuffs (coarse and concentrated). The relation of food to product; compounding rations. Armsby's "Cattle Feeding," lectures and discussion. — Assistant Professor Cooley.

Senior year, seven weeks, first semester, four hours a week, elective. Dairying: selection and management of the dairy farm, dairy cattle, chemical and physical properties of milk, etc., cream, butter, cheese and by-products. — Assistant Professor Cooley.

Senior year, first semester, four exercises a week for eight weeks. Dairy practice: use of separators, Babcock tester, butter making, etc. — Specialists.

Senior year, second semester, elective. The crops of the farm and crop rotation; including a study of the origin and agricultural botany of all the leading crops of the farm, — annual forage crops, grasses and legumes, cereals, root crops, vegetables, tobacco and other special commercial crops: the production and uses of each; the varieties and methods of improvement; the adaptation to soil; the special manurial requirements and the methods of raising and harvesting are considered. Lectures, reference books and field work. — Professor Brooks.

Senior year, second semester, elective. Agricultural experimentation: objects, methods, sources of error; interpretation of results. Lectures and study of reports, bulletins, etc. — Professor Brooks.

Senior year, second semester, elective. Farm management: selection of the farm, its subdivision and equipment, buildings, fences, roads, water supply; farm capital, permanent, perishable and floating; the labor of the farm and its management; farm power and farm machinery. Lectures and practical exercises.—Professor Brooks.

Seminar courses, by arrangement, for advanced students.

Special problems requiring experiment or other research investigation will be assigned to students fitted for and desiring such work.

Training and practice in the use of farm implements and machines by arrangement when desired.

HORTICULTURE.

This department endeavors to give the student a working knowledge of horticulture on its practical and on its scientific side. The attempt is made to inculcate a taste and an enthusiasm for horticultural pursuits, in place of distaste and dislike for the drudgery of farm life. On these things success and further progress chiefly depend.

The courses now offered are as follows, though others will be added as occasion requires:—

1. Sophomore class, second semester. The fundamental operations of horticulture, — propagation, pruning and cultivation, — as related to the physiology of the plant. During the first half

of this course Bailey's "Nursery Book" is used as a text. — Mr. Blake.

- 2. Junior year, first semester. Pomology: this course covers the three natural divisions of the subject, viz.: (a) systematic pomology, or the study of the fruits themselves; (b) practical pomology, or the practice of fruit growing; (c) commercial pomology, or the principles underlying the marketing of fruits. The course is pursued by means of text-book, lectures, laboratory and field exercises. Mr. Blake.
- 3. Junior year, first semester, four periods weekly. Plant breeding: based on a thorough examination of the laws of heredity and of variation, and of the principal theories of evolution. Lectures, accompanied by practice and direct experiments in crossing and hybridizing plants. Professor Waugh.
- 4. Junior year, second semester, four periods weekly. Market gardening, including vegetables and small fruits; locations, soils, methods of cultivation and marketing. Text-book, lectures and field exercises. Mr. Blake.
- 5. Individual problems will be assigned to seniors who elect horticulture. This gives the student an opportunity for specialization in various lines of fruit growing, vegetable culture, greenhouse management, landscape gardening, etc. Professor Waugh, Mr. Blake and Mr. Canning.

A seminar, made up of all students electing advanced work in horticulture or landscape gardening, meets weekly for the discussion of any matters pertaining to the subject. Successful and noted horticulturists from outside the college are frequently present at these meetings, to speak on the topics with which they are especially identified.

Landscape Gardening.

The college wishes to promote the work in landscape gardening in every way possible. The aim of the courses is to give the general student an understanding of the fundamental principles of design and of good taste as applied to gardening, and to prepare advanced students for the practice of landscape gardening in its various branches.

Although a variety of other work along related lines is available, the courses now definitely offered are as follows:—

1. Junior year, first and second semesters, four hours a week. Elements of landscape design: the fundamental principles under-

lying the artistic development of parks, estates, gardens and other areas, together with some of the simpler applications to practical conditions. — Professor Waugh and Mr. Hatch.

- 2. Junior year, first semester, three periods weekly. Arboriculture: trees, shrubs and other ornamental plants; their propagation, planting and care. Field and laboratory exercises and lectures. Professor Waugh, Mr. Canning and Mr. Hatch.
- 3. Senior year, first and second semesters, four laboratory periods weekly. Advanced landscape gardening: lectures, conferences, field exercises and extensive practice work with criticism. The student is given definite problems to solve, these problems being arranged in such an order as to develop the subject logically in the student's mind. Professor WAUGH.

CHEMISTRY.

This course aims to inculcate accurate observation, logical thinking, systematic and constant industry, together with a comprehensive knowledge of the subject. Instruction is given by text-book, lectures and a large amount of laboratory work under adequate supervision. The laboratory work at first consists of a study of the properties of elementary matter, analysis of simple combinations and their artificial preparation. This is followed by a quantitative analysis of salts, minerals, soils, fertilizers, animal and vegetable products. The advanced instruction takes up the chemistry of various manufacturing industries, especially those of agricultural interest, such as the production of sugar, starch and dairy products; the preparation of animal and plant foods, their digestive assimilation and economic use; the official analysis of fertilizers, fodders and foods; and the analysis of soils, waters, milk, wine and other animal and vegetable products.

The courses are as follows:—

Freshman year, second half of second semester, four hours a week. General chemistry, part 1, principles of chemistry, nonmetals. Newth's "Inorganic Chemistry." — Assistant Professor Howard.

Sophomore year, first semester, six hours a week. General chemistry, part 2, metals. — Assistant Professor Howard.

Second semester, five hours a week. Subject continued; dry analysis. — Assistant Professor Howard.

Junior year, first semester, eight hours a week. Qualitative

and quantitative analysis; organic chemistry. Four hours a week, special subject. — Professor Wellington.

Second semester, ten hours a week. Organic chemistry. Remsen's "Organic Chemistry." Five hours a week, special subject.

— Professor Wellington.

Senior year, elective, first semester, three hours a week. Chemical industries. — Professor Goessmann.

Eight hours a week, quantitative analysis and physical chemistry. Reychler-McCrae's "Physical Chemistry." — Professor Wellington and Assistant Professor Howard.

Second semester, eight hours a week. Advanced work, with lectures. — Professor Wellington.

GEOLOGY.

- 1. Mineralogy, junior year, second semester, six weeks, three hours a week. A course of systematic determinative mineralogy, based on Brush's "Manual." This work is carried on in the laboratory, and consists in determining the minerals by a study of lustre, fusibility, hardness, color, streak, specific gravity, etc., and by some of the simpler chemical tests. Assistant Professor Howard.
- 2. Geology, junior year, second semester, twelve weeks, three hours a week. Structural, dynamical, physiographical and historical, based upon Scott's "Introduction to Geology." The course aims to give a review of the physical condition of the earth; the various dynamic agencies, and the results of their activities; the origin and structure of the rocks; and, finally, the geological history of the globe, and the appearance in time and the development of the principal races of animals and plants. The museum, lantern slides and the classic Connecticut valley afford ample means for illustration. Professor Lull.

Zoölogy.

1. Anatomy and physiology, freshman year, one-half of the second semester, four hours a week. Lectures based upon Martin's "The Human Body," advanced course, illustrated by demonstrations from the charts and models and from microscopic and other preparations. The fact that the subject is required for entrance makes it possible in a comparatively brief period to review the main features of human anatomy, the generally accepted views concerning the physiology of the various organs,

and the more essential laws of health; and, aside from the practical value of the last, the knowledge of the human system thus gained aids greatly in the zoölogical work to come. — Professor Lull.

- 2. Zoölogy, sophomore year, first semester, two periods a week. This is mainly a laboratory course, the aim being to familiarize the student with the structure of a number of typical forms, representative of the chief phyla of the animal kingdom, to train him to more precise habits of observation, and to lay the foundation for a more thorough understanding of laboratory technique. Lectures, amply illustrated by specimens, charts and lantern slides, supplement and render orderly the knowledge gained in the laboratory. Professor Lull.
- 3. Zoölogy, elective, junior year, four periods a week. A course in comparative morphology and systematic zoölogy, based upon Parker and Haswell's "Text-book of Zoölogy." Opportunity is given for the careful dissection of each of the typical forms or its equivalent, described in the text, with a further series of animals for comparative study. Special attention is paid to individual and racial development, adaptation, relationship of animals to one another and to plants, geological and geographical distribution of animals, and the economic importance of the different groups, except the insects, both living and extinct. The lectures are illustrated by the very complete museum collection. Professor Lull.

ECONOMICS AND GOVERNMENT.

The aim of this department is to introduce the student to such studies as may enable him to deal with economic problems and to fulfill his social and political duties. In all work of the department the text-book and lecture systems are combined.

1. Economics, junior year, first semester, four hours a week. Ely's "Outlines of Economics" and Taylor's "Introduction to Agricultural Economics" are used as text-books. The lectures on general economics are intended to supplement Ely's book, with emphasis on present-day problems. The lectures on agricultural economics treat of the history of the agricultural industry, and existing agricultural economic conditions and tendencies in the United States. Such subjects as the resources of the various geographical divisions of our country in land and labor, the application of division of labor to agriculture specialized and diversified farming, the large and small farm

systems, tenure of farm lands, the transportation of farm products, tendencies toward agricultural co-operation, and those characteristics of agriculture which make it especially attractive to the liberally educated mind, are briefly treated. Special papers on subjects selected by the individual students from an assigned list are read and discussed in the class room.

2. Government, senior year, four hours a week, during the last half of the first semester and the whole of the second. Woodburn's "The American Republic" is used as a text-book, supplemented by assigned readings in Hart's "Actual Government" and Buchanon's "Massachusetts Town Officers." The lectures treat of general sociology, the theory and forms of the State, the origin and history of American political institutions, political parties and movements in the United States, and eminent political leaders and interpreters of the Constitution. Special attention is given to the United States Department of Agriculture, State Board of Agriculture, agricultural education and the organization of the New England country town. — Mr. Holcomb.

Lectures on law, second semester, one hour a week. This course treats of laws relating to business, especially to business connected with rural affairs, citizenship, domestic relations, farming contracts, riparian rights, real estate and common forms of conveyance. Practical work is required, such as may fit one to perform the duties of a justice of the peace. — Mr. Lyman.

ENGLISH.

This department aims to secure: (a) ability to give written and oral expression of thought in correct, effective English; (b) acquaintance with the masterpieces of American and English literature; (c) ability to present, logically and forcibly, oral and written arguments on propositions assigned for debate.

The following courses are offered: under (a) rhetoric and oratory; under (b) American literature and English literature; under (c) argumentation. The elective course in senior year is in language and literature.

1. Rhetoric. — This course extends through the two semesters of freshman year and through the second semester of sophomore year. In the first semester of freshman year work is confined to essay writing and to personal criticism, by the instructor, of the students' compositions. This criticism is offered at stated intervals to each student individually, according to a posted schedule

of appointments. At the beginning of the semester necessary information with regard to the preparation of essays is furnished each student. In the second semester of freshman year the study of literary types is undertaken in the form of class room work in prose composition, including exposition, persuasion, narration, description and in prose diction, including usage and style. Special attention is given to the training of the inventive ability of the student. The text-book used is Baldwin's "College Manual of Rhetoric." In the second semester of sophomore year individual work in essay writing is again taken up, largely based upon the previous work of the class in American literature (see 3, below). Here also personal criticism is offered.—Assistant Professor Babson.

- 2. Oratory. Individual drill in declamation, first in private and then before the class, is given during the second semester of freshman year. The choice of speakers for the Burnham prizes is based upon this work. In the junior year, during the first semester, at least two orations, upon subjects assigned or chosen, are written, and delivered before the class. Every oration is criticised by the instructor before it is committed to memory by the student. The choice of speakers for the Flint prizes in oratory is based upon this work. Professor Mills and Assistant Professor Babson.
- 3. Literature. American literature is studied in the first semester of sophomore year, three hours a week. The course comprises, first, the careful study of a text-book (Newcomer's "American Literature"), together with recitations based upon the same; secondly, the taking of notes from lectures, dwelling upon topics not fully treated in the text-book; and, thirdly, the reading outside of the class room of assigned selections from the prose and poetical works of standard American authors. Assistant Professor Babson.

The history of English literature is studied during the second semester of sophomore year, four hours a week. The work is based upon a text-book, this year Johnson's "History of English and American Literature." The topical method is followed in recitation, and, instead of formal lectures, there are discussions of points requiring a fuller development than the text-book gives. Collateral readings of literature are required. Frequent written tests are given, in which particular attention is given to (a) the definition of words used in the text-book; (b) the use of English in the development of the topics unfolded in the text-book or discussed in the class room. — Professor Mills.

4. Argumentation. — Four hours a week during the first semester of junior year are given to written and oral argumentation. The course is outlined as follows: (a) principles of argumentation as laid down in a text-book or by lecture; (b) briefs and briefmaking; (c) briefs developed into forensics and submitted for personal criticism; (d) debates. — Professor Mills.

Senior elective course, two semesters, four hours a week. The work in this course is upon the following subjects: (a) English language, its origin, history and development, with particular attention to the study of words as outlined in Anderson's "A Study of English Words;" (b) English literature, principally of the eighteenth and nineteenth centuries. — Professor MILLS.

VETERINARY SCIENCE.

The course of instruction in veterinary science has been arranged to meet the demands of the students who, after graduation, purpose following some line of work in practical agriculture. Particular stress is laid upon matters relating to the prevention of disease in animals. In addition, the interests of prospective students of human and comparative medicine have been taken into account in the arrangement of the course of study. The subject is taught by lectures, laboratory exercises, demonstration and clinics.

Senior year, elective, first semester, four hours a week. Veterinary hygiene, comparative (veterinary) anatomy, general pathology. — Professor Paige.

Second semester, four hours a week. Veterinary materia medica and therapeutics; theory and practice of veterinary medicine; general, special and operative surgery; veterinary bacteriology and parasitology; medical and surgical clinics.—Professor Paige.

BACTERIOLOGY.

The instruction in bacteriology is given by means of lectures, recitations and laboratory exercises. The object of this course of study is to acquaint the student with the various organisms found in air, water, soil, milk and the body, and their relation to such processes as decomposition, fermentation, digestion and production of disease. The toxic substances resulting from the growth of organisms are considered, as well as the antitoxin used to counteract their action.

Senior year, first half of the first semester, four laboratory exercises, of two hours each a week, required. — Professor PAIGE.

BOTANY.

The object of the course in botany is to teach those topics pertaining to the science which have a bearing upon economic and scientific agriculture. The undergraduate work extends through six semesters. The first two semesters are required. An outline of the course follows:—

Freshman year, first semester, five hours a week. Laboratory work and lectures; histology and physiology of the higher plants. This includes a study of the minute structure of the plant organism, such as stems, roots, leaves, seeds, etc., and of their functions and chemical and physical properties. This course extends into the next semester. — Mr. Osmun.

Freshman year, second semester, three hours a week. Laboratory work, lectures and text-book; outlines of classification and morphology of the higher plants. This course follows the preceding one, and commences about the first of March. It is devoted to a study of the relationship of plants, their gross structure, together with extensive individual practice in flower analysis. An herbarium of two hundred species of plants is required. — Mr. OSMUN.

Junior year, first semester, five hours a week. Two laboratory exercises and one lecture period a week. Cryptogamic botany. This includes a study of the lower forms of plant life, and is necessary for a comprehension of the following courses. — Mr. Osmun.

Junior year, second semester, five hours a week. Two laboratory exercises and one lecture period a week. Elements of vegetable pathology and physiology. This course includes a study of the common fungous diseases of crops, and consideration of the method of prevention and control of the same. The plant's function as related to susceptibility to disease is also taken up. All of the junior botany is included in four of the junior elective courses. — Professor Stone.

Senior year, elective, both semesters. Three laboratory exercises and one lecture period a week. (a) Plant physiology; (b) plant pathology. Both courses are optional. These courses are adapted to students who desire a more detailed knowledge of plant diseases and plant physiology. Extensive use is made of the valuable and constantly increasing experiment station literature. — Professor Stone.

1906.7

MATHEMATICS, PHYSICS AND ENGINEERING.

This department has charge of the instruction in mathematics, physics, civil engineering and drawing. The aim is to secure thorough work in the fundamental principles, and train the mind in clear and logical thinking. The application of the subjects to practical problems is given special attention. The work of the department extends over the four years, as outlined below.

Mathematics.

Freshman year, first semester, five hours a week. Higher algebra, including ratio and proportion, progressive binomial theorem, series undetermined coefficients, logarithms, continued fractions, permutations. Wells' "College Algebra." — Professor Ostrander and Professor Hasbrouck.

Second semester, two hours a week. Solid geometry. Wells' "Solid Geometry." — Professor Hasbrouck.

Plane trigonometry, two hours a week. Lyman and Goddard's "Trigonometry." — Professor Ostrander.

Junior year, for mathematical and chemical students, first semester, four hours a week. Analytic geometry of the line, circle, conic sections and higher plane curves. Nichols' "Analytic Geometry." — Professor Hasbrouck.

Second semester, four hours a week. Differential and integral calculus. Osborne's "Calculus." — Professor Hasbrouck.

Physics.

Sophomore year, first semester, four hours a week. Elementary mechanics of solids, liquids and gases, heat and sound. Merriman's "Elements of Mechanics," Carhart's "University Physics." — Professor Hasbrouck.

Second semester, four hours a week. Electricity, magnetism and light. Carhart's "University Physics." — Professor Hasbrouck.

Senior year, elective for those students who have taken junior mathematics; first semester, four hours a week. Analytic mechanics. Peck's "Analytic Mechanics." — Professor Hasbrouck.

Second semester, four hours a week. Laboratory work. — Professor Hasbrouck.

Civil Engineering and Surveying.

Sophomore year, second semester, two exercises of two hours a week. Plain surveying with field work, including the use of the usual surveying instruments. Text-book and lectures.—Professor OSTRANDER.

Instruction in civil engineering will be given in two distinct courses of one year each, the courses alternating. They will be open to students of the junior and senior classes as indicated below. The course for 1906–07 will be for students in mathematics only. First semester, three hours' recitation and two hours' draughting a week. Stresses in roofs, bridges and graphic statics. Merriman and Jacoby's "Roofs and Bridges," Parts I. and II.

Second semester, four hours a week. Hydraulics and sanitary engineering. Merriman's "Hydraulics and Lectures." — Professor OSTRANDER.

The course of 1907-08 will be required of juniors and seniors taking the courses in mathematics and landscape gardening.

First semester, four hours a week. Strength of materials, foundations and masonry construction. Text-book and lectures.

— Professor Ostrander.

Second semester, three hours' recitation or lectures and two hours' field work or draughting a week. Topographic and higher surveying, highway construction, the measurement of earth work, pavements and railroad construction. Text-book and lectures.—Professor Ostrander.

Drawing.

Junior year, first semester, two two-hour sessions a week for students in mathematics and landscape gardening; free-hand drawing.

Second semester, two two-hour sessions a week. Mechanical and topographic drawing.

ENTOMOLOGY.

The importance of a knowledge of insects in every department of life is recognized by placing an introductory course in this subject as a required study in the junior elective courses: (1) agriculture, (2) horticulture, (3) biology, (4) landscape gardening. For those who desire a further knowledge of it, because of its importance to their future occupations, a senior elective is offered, so shaped as to be of especial value for those who expect

to take up agriculture, horticulture, landscape gardening, forestry or science teaching as life occupations.

Junior year, second semester, four exercises a week, of two hours each. Lectures, laboratory and field work; general consideration of insect structure and life histories; systematic study of the groups of insects, with particular reference to those of economic importance; methods for preventing or checking their ravages; insecticides and apparatus for their use; the collecting, mounting and naming of insects, and examination of the work of insects in the field and laboratory. — Professor H. T. Fernald.

Senior year, elective, open to those who have taken the junior entomology, first and second semesters, three laboratory exercises of two hours each, and one lecture, a week. Lectures, laboratory and field work; advanced morphology of insects; economic entomology; training in the determination of insects; use of literature on entomology; study of life histories; value and application of insecticides; thesis on insects most closely related to future occupation of the student. — Professors C. H. Fernald and H. T. Fernald.

MODERN LANGUAGES.

French. — Course I.: required, four hours a week for both semesters of the freshman year. The special aim of this course is to enable the student to lay the foundation of an ability to read modern French fluently, special reference being had to scientific journals and treatises. The object of the grammar drill is to give not only instruction in the broader and more general topics, but also a thorough drill in the idiomatic peculiarities of the language, a thorough comprehension of which is held to be absolutely necessary to a correct and accurate translation. Great stress is laid upon the acquisition of a good vocabulary, and absolute accuracy in translation is insisted upon. The course is further strengthened by drill in pronunciation, exercises and composition, and, in general, in whatever tends to increase interest, facility and ability in translation.

Course II. is given, upon demand, as a supplement to Course I., and is an elective requiring four hours a week for both semesters of senior year. Its aim is, primarily, to furnish by an additional year's training a greater practical efficiency in translation than can be attained merely by the completion of Course I.; and, secondarily, to equip the student with a general knowledge of scientific French literature. Constant advanced

drill is furnished along the general lines of Course I., with the object of attaining such mastery of the language that it may be easily used as a tool in scientific pursuits and investigations of any nature. Students who have not attained a good rank in Course I. are not encouraged to elect Course II.

Though the main object of both courses is practical, a general attempt is constantly made, by the comparison of French and English and by occasional lectures on French life and customs, to interest the student in the study and better comprehension of the genesis of his own language, and to encourage a desire for a broad and general culture.

Spanish. — Given at present as an elective for four hours a week during both semesters of the year. This course is open as a regular study to seniors, and to freshmen who upon entering college have passed off French or German (Course I.), and also as an extra to any student in good and regular standing. It is offered in response to the recognized demand in Spanish-speaking countries for graduates of agricultural colleges who have made a specialty of agriculture, entomology, horticulture, engineering, etc. Students planning future fields of work in such countries are thus enabled to acquire sufficient facility in reading, writing and speaking the Spanish language to start them to the best advantage. The earlier work is based upon some such grammar as Marion and Garennes' "Introducción á la Lengua Castellana." The course is strengthened by writing from dictation, and by the reading of books characteristic of Spanish life and customs.

German. — Course I.: required for both semesters of sophomore year, three hours a week first semester, three hours a week second semester. An understanding of the rudiments of grammar, facility in translation and an ability to pronounce the language and to understand simple spoken German are the main objects in view. — Assistant Professor Babson.

Course II.: elective for both semesters of senior year, four hours a week. Special attention is given to the reading of German, particularly to German of a scientific nature. Work is also required in prose composition throughout the year. Accuracy in pronunciation, the ability to understand German as spoken in the class room, and to converse within reasonable limits, are also features of this course. Students electing Course II. must have a good record in Course I., or must pass a satisfactory examination therein. — Assistant Professor Babson.

MILITARY SCIENCE.

In compliance with the provisions of an act of Congress of July 2, 1862, military instruction under a regular army officer, detailed for this purpose, is required of all able-bodied male students. Men are excused from attendance upon the exercises of this department only on a surgeon's certificate, given by a resident physician.

The object of such instruction is clearly to disseminate the elements of military knowledge throughout the country, that, in case of sudden emergency, a sufficient number of well-trained educated men may be found to command and properly to instruct volunteer troops. Military drill also has the object in view of giving the student physical exercise, teaching respect and obedience to those in authority without detracting from pride of manhood, and developing a military bearing and courtesy becoming in a citizen as in a soldier.

In order to further stimulate the study of military science in colleges, the War Department issued General Orders, No. 101, dated Washington, D. C., June 29, 1905, as follows:—

The reports of the regular inspections of the colleges and schools to which officers of the Army are detailed, in pursuance of law, as principals or instructors, will annually hereafter be submitted to the general staff for its critical examination, and the chief of staff will report to the Secretary of War, from the institutions which have maintained a high standard, the six institutions whose students have exhibited the greatest interest, application and proficiency in military training and knowledge. The President authorizes the announcement that an appointment as second lieutenant in the regular army will be awarded to an honor graduate of each one of the six institutions, provided sufficient vacancies exist after caring for the graduates of the military academy at West Point and the successful competitors in the annual examination of enlisted men. . . .

By order of the Secretary of War,

Adna R. Chaffee, Lieutenant-General, Chief of Staff.

Course I.: out of doors, an exercise of one hour, three times a week, Mondays, Tuesdays and Thursdays; infantry drill by squad, company, and battalion; guard mounting, dress parade, inspection and review; artillery drill by detachment; target practice.

All drills are in the drill hall during the winter months and inclement weather.

Students assigned to the college band are given instruction and practice in band music and band evolutions, in place of drills and recitations.

Course II.: theoretical instruction for freshmen, one hour a week for both semesters, comprises recitations, "Infantry Drill Regulations," "Manual of Guard Duty and Firing Regulations for Small Arms;" "United States Service Manual."

Course III.: theoretical instruction for seniors for both semesters, one hour a week, embraces drill and army regulations; duties of sentinels and guard duty, elements of military science, preparation of necessary reports and returns pertaining to a company of infantry, and a thesis on some military subject; Wagner's "Elements of Military Science," "Field Service Regulations." — Captain MARTIN.

Synopsis of the Courses of Instruction.

[The figures indicate the number of exercises a week; light-faced type, recitation periods of one hour each: heavy-faced type, laboratory periods of two hours each.]

SENIOR YEAR.

First Semester.

The following subjects are required in all courses: --

Bacteriology, half semester, 4, Constitution of the United States	, hal	If ser	neste	r, 4,			4	
Military science,						•	1	=
Second S	eme	ster.					_	Ð
Constitution of the United States							4	
Military science,		•			•		1	_
							_	- 5

From the following the student must elect three courses, closely correlated with his junior year course; only one course in language may be elected:—

Agriculture,	4	Physics, .	•		4
Horticulture, 3+1,	4				4
Veterinary,	4	English, .			4
Botany, 3+1,	4	French, .			4
Landscape gardening, 3+1,	4	German, .			4
Entomology, 3+1,	4	Spanish, .			4
Chemistry, 3+1,	4	Latin, .			4
Floriculture, 3+1,	4				

SHORT COURSES.

These courses are open to persons of both sexes. Applicants must be at least sixteen years of age, and must furnish papers certifying good moral character. No entrance examination is required. Tuition is free to citizens of the United States. The same privileges in regard to room and board obtain as with other students. Attendance upon chapel is required. The usual fees are charged for apparatus and material used in laboratories. Attendance upon military drill is not expected.

I. DAIRY FARMING.	Hours per Week.
Soils, tillage and methods of soil improvement; manures and fer-	
tilizers and their use; crops and rotations,	4
Breeds and breeding of dairy stock; judging to scale of points, .	2
Fodders and feeding farm live stock,	1
Stable construction and sanitation,	1
Common diseases of stock; prevention and treatment,	1

II.	Но	RTIC	ULTUI	RE.					Hours per Week.
Soils, tillage, manures, etc.,									. 4
Plant propagation and prunir	ıg,								3

Practice work in seed testing, seeding, grafting, budding, transplanting, judging fruit, etc.

General fruit growing, .

Botany,

Entomology,

Market gardening, . .

Begins first Wednesday in January, and continues ten weeks. This course will not be given unless at least eight men register for it.

III. BEE CULTURE.			Total Hours.
The structure of bees, with special reference to their work	k (Pro	of.	
H. T. Fernald),			3
Flowers and fruits in their relations to bees (Professor St	one),		10
Honey crops, and how to grow them (Professor Brooks),			5
Bees and bee keepers' supplies (Professor Paige),			10
Work in the apiary, under direction of an expert,			20
Instruction by specialists,			4

This course begins the fourth Wednesday in May, and continues two weeks, but will not be given unless applied for by at least six students.

EQUIPMENT OF THE SEVERAL DEPARTMENTS.

AGRICULTURE.

The part of the college estate assigned to the department of agriculture contains one hundred and sixty acres of improved land, forty acres of pasture and sixteen acres of woodland. The

latest inventions in improved agricultural tools and machinery are in practical use. The large and commodious barn and stables destroyed by fire in November, 1905, were stocked with the best breeds of horses, cattle, sheep and swine, and will be replaced by new buildings at as early a date as possible. The laboratory is provided with the latest forms of apparatus for mechanical analysis of soils and determination of their physical character-Provision has been made in the laboratory for the study of seeds and crops and for germination trials. Power has been introduced into the laboratory, so that farm machinery may be operated for purposes of demonstration. The department has also a line of instruments for use in drainage and irrigation practicums. The museum contains a collection of implements, seeds, plants and models of animals, all of which are designed to illustrate the evolution and the theory and practice of agriculture. The department has assigned to its use one lecture room with museum attached, and five rooms for laboratory and dairy purposes.

HORTICULTURE.

For illustration of the science and the practice of horticulture the department possesses about one hundred acres devoted to orchards planted with all the leading old and all new varieties of apples, pears, peaches, plums, Japanese and American cherries, quinces, chestnuts, hickory nuts and walnuts; vineyards containing nearly two hundred named varieties of grapes, for sale, beside several hundred seedlings, and about an acre devoted to a commercial crop of a few market varieties; nurseries containing all kinds of fruit and ornamental trees, shrubs and plants, in all stages of growth, from the seed and cuttings to those ready for planting in the orchard or field; small fruit plantations containing valuable varieties, and showing the modern methods of training, pruning and cultivation; extensive greenhouses that contain not only valuable collections of specimen plants, representing types of the flora of the world, but also the most valuable economic plants, such as the orange, banana, lemon, guava, pomegranate, sago palm, arrowroot, tapioca, ginger, pepper, tea, coffee, camphor, India rubber, Manila hemp, banyan tree, etc. All the common greenhouse and outdoor decorative plants are found, and small quantities of roses, carnations, chrysanthemums and other commercial flowering plants are grown, to illustrate the business of horticulture. All vegetable

crops, now so largely grown under glass, are grown in limited quantities for purposes of instruction and for market.

For illustration in the work of landscape gardening, the grounds about the greenhouses, as well as that part of the grounds known as the Clark Park, are planted with a very large and complete collection of ornamental trees, shrubs and plants.

For forestry there are two large groves of trees of varying ages, from those of almost primeval growth to the youngest seedlings, besides several plantations of younger growth either natural or planted; and in the Botanical Museum there is a very complete collection of woods of Massachusetts.

The work in horticulture, floriculture and landscape gardening is now much better provided for than in the past, through the completion of the new Wilder Hall. This contains three class rooms, three student laboratories, a large drafting room and a library, besides offices, a museum and private laboratories. It is a substantial structure, three stories high, containing all the most modern appliances, and exemplifying the best ideas in college laboratory building. It is practically fireproof, being constructed of red brick, terra cotta and tile. The floors and the roof are of tile.

All kinds of pumps and other appliances for distributing insecticides and fungicides, as well as various modern tools and implements, are in constant use.

A small cold-storage room makes possible the keeping of the products beyond their natural season, and illustrates one of the most important adjuncts to the business of modern horticulture.

CHEMISTRY.

This department has fourteen rooms, well adapted to their special uses. They are supplied with a large assortment of apparatus and chemical materials. The lecture room on the second floor has a seating capacity for seventy students. Immediately adjoining it are four smaller rooms, used for storing apparatus and preparing materials for the lecture table. The laboratory for beginners is a large room on the first floor, furnished with forty working tables. Each table is provided with reagents and apparatus for independent work. A well-filled laboratory for advanced work is also provided on the first floor. A weighing room has six balances, and improved apparatus for determining densities of solids, liquids and gases. The apparatus includes,

besides balances, a microscope, a spectroscope, a polariscope, a photometer, a barometer, and numerous models and sets of apparatus. The various rooms are furnished with an extensive collection of industrial charts. A valuable and growing collection of specimens and samples, fitted to illustrate different subjects taught, is also provided. This includes rocks, minerals, soils, raw and manufactured fertilizers, foods, including milking products, fibres and other vegetable and animal products, and artificial preparations of mineral and organic compounds. Series of preparations are used for illustrating the various stages of different manufactures from raw materials to finished product.

GEOLOGY.

Geological teaching is illustrated by a very complete series of minerals, the State collection of rocks of Massachusetts, a series of Ward's fossils and casts of fossils, models and charts.

Zoölogy.

Zoölogical Laboratory. — A large, well-lighted room, situated in the old chapel building, is amply supplied with the best apparatus obtainable. The equipment includes compound and simple microscopes, dissecting instruments and trays, an incubator, paraffin bath, microtomes, etc., also a reference library, containing the current zoölogical journals and a good series of mounted slides for the microscope.

Zoölogical Lecture Room. — The lecture room is in south college, adjacent to the museum; its equipment includes, besides the museum specimens, the Leuckart series of charts, and many specially made charts as well; the Auzoux models, illustrative of human and comparative anatomy; and an electric stereopticon.

Museum of Zoölogy. — The museum is mainly for the purpose of exhibiting those forms treated of in the lecture and laboratory courses, but, in addition to this, the aim has been to show as fully as possible the fauna of the Commonwealth, and those types which show the evolution and the relationship of the members of the animal kingdom. The total number of specimens contained in the museum now exceeds eleven thousand. The museum is open to the public from 3.30 to 5.30 P.M. each week day.

Entomological Laboratory. — The equipment for work in entomology during the senior year and for graduate students is unusually good. The laboratory building contains a large room

for laboratory work, provided with tables, dissecting and compound microscopes, microtomes, reagents and glassware. portion of the building is fitted up as a lecture room. room is devoted to library purposes, and contains a card catalogue of over fifty thousand cards, devoted to the literature of insects. In addition to a well-selected list of entomological works in this room, the college library has an unusual number of rare and valuable books on this subject. This is supplemented by the private entomological library of the professor in charge, which contains over twenty-five hundred volumes, many of which cannot be found elsewhere in the United States. In another room is a large and growing collection of insects, both adult and in the early stages, which is of much assistance to the students. the laboratory is directly connected with the insectary of the Hatch Experiment Station, the facilities of the latter are directly available. The apparatus room of the insectary, with its samples of spray pumps, nozzles and other articles for the practical treatment of insects; the chemical room fitted up for the analysis of insecticides and other chemico-entomological work; and a greenhouse, where plants infested by injurious insects are under continual observation and experimental treatment, - all these are available to the student. In addition, several private laboratory rooms and a photographing room with an unusually good equipment of cameras are provided. The large greenhouses, grounds, gardens and orchards of the college are also to be mentioned under this head, providing, as they do, a wide range of subjects for study of the attacks of injurious insects under natural conditions.

VETERINARY SCIENCE.

The department has for its sole use a commodious and modern laboratory and hospital stable, erected in 1899. Both buildings are constructed in accordance with the latest ideas regarding sanitation. Every precaution has been taken in the arrangement of details to prevent the spread of disease, and to provide for effective heating, lighting, ventilation and disinfection.

The laboratory building contains a large working laboratory for student use, and several small private laboratories for special work. In addition, there is a lecture hall, museum, demonstration room, photographing room and workshop. The hospital stable contains a pharmacy, operating hall, post-mortem and disinfecting room, besides a section for poultry, one for cats and dogs, and six sections, separated from each other, for the accommodation of horses, cattle, sheep, swine and other domestic animals.

The laboratory equipment consists of a dissecting Auzoux model of the horse, Auzoux models of the foot and the legs, showing the anatomy and the diseases of every part. There are skeletons of the horse, cow, sheep, dog and pig, and, in addition, a growing collection of anatomical and pathological specimens. The lecture room is provided with numerous maps, charts and diagrams, which are made use of in connection with lectures and demonstrations.

The laboratories are supplied with the most modern highpower microscopes, microtomes, incubators and sterilizers, for the use of students taking the work in bacteriology and parasitology.

BOTANY.

The botanical department possesses a general laboratory, furnished with tables and benches for microscopical and physiological work, and with a dark closet for photographic purposes. There are forty compound microscopes, twenty-three dissecting microscopes, a micro-photographic and landscape camera and various accessories; also microtomes, paraffin baths, etc., for histological work; a large and useful collection of physiological apparatus for the study of photo-synthesis, respiration, metabolism, transpiration, heliotropism, geotropism, hydrotropism, galvanotropism, chemotropism, and other irritable phenomena connected with plants; a set of apparatus for the study of the mechanical constituents of the soil; a large and unique outfit of electrical appliances for the study of all phenomena related to electricity and plant growing; various devices for the study of mechanics of plant structure; numerous contrivances to determine the power exerted by living plant organisms; several types of self-registering auxanometers, used to measure the rate of growth of plants; self-registering thermometers, and hygrometers for recording constant changes in conditions.

A small special laboratory for graduate students is equipped with microscopes and other apparatus and reagents for advanced work.

Botanical Lecture Room. — The botanical lecture room adjoining the laboratory is adapted for general work in morphology and flower analysis, with opportunity to use dissecting micro-

scopes. It contains a movable chart system, arranged to display over three thousand figures relating to the structure and function of plants.

MATHEMATICS, PHYSICS AND ENGINEERING.

Surveying. — The department possesses a considerable number of the usual surveying instruments, with the use of which the students are required to become familiar by performing a required amount of field work. Among the larger instruments are two plain compasses, railroad compass with telescope, surveyor's transit, two engineer's transits with vertical arc and level, solar compass, omnimeter with verniers reading to ten seconds, adapted to geodetic work, Queen plane table, two wye levels, dumpy level, builder's level, sextant, hand level, and a large assortment of levelling rods, flag poles, chains, tapes, etc. For draughting, a vernier protractor, pantograph, parallel rule, etc., are available.

Physics. — Among the apparatus in use for general instruction in general physical processes may be found a set of United States standard weights and measures, precision balances, spherometer, vernier calipers, etc.; in mechanics, apparatus to illustrate the laws of falling bodies, systems of pulleys and levers, motion on an incline plane, and the phenomena connected with the mechanics of liquids and gases. The usual apparatus for lecture illustration in heat, light and sound are also in the possession of the department. In electricity, the equipment consists of apparatus for both lecture illustration and laboratory work, among which may be enumerated a full set of Weston ammeters and volt meters, a Carhart-Clark standard cell, Mascart quadrant electrometer, Siemens electro-dynamometer, as well as reflecting galvanometers and Wheatstone bridges for ordinary determinations of currents and resistance.

MILITARY SCIENCE.

In addition to a large campus, suitable for battalion drill, the military department possesses a special building in which there is a drill room 60 by 135 feet, an armory, a recitation room, an office for the commandant, and a field gun and gallery practice room. The building also has a large bathroom immediately adjoining the armory.

In a plot of ground west of the college buildings there is a rifle range, marked for practice at distances of 100 and 200 yards. The range is furnished with a revolving target suitably protected

by earthworks. The national government supplies, for the use of the department, arms and equipments; the Springfield cadet rifle and two breech-loading rifled steel guns, calibre 3.2, with complete equipments and ammunition.

The State supplies instruments for the college band.
Students are held responsible for all articles of public property while in their possession.

THE CHAPEL-LIBRARY BUILDING.

One of the most attractive and commodious buildings belonging to the college is the chapel-library. It has a commanding position, approximately in the centre of the group of buildings adjoining the campus. The chapel occupies the entire second story. A large room, capable of seating about four hundred, is used for daily prayers, Sunday services, the various commencement exercises, and not infrequently for lectures or social gatherings. The room has an excellent pipe organ. Two adjoining rooms are used for small religious gatherings, and meetings of the class teachers and of the faculty. The rooms can be thrown open so as to become a part of the main audience hall.

The entire lower story is given over to the library. This library is available for reference or investigation, and is open daily, except on Sundays, from 8 A.M. to 5 P.M. and from 6.30 to 8.30 P.M. It is open on Sundays from 10 A.M. to 1 P.M. volumes at present number 26,665. The library contains carefully selected books in the departments of agriculture, horticulture, botany, entomology and other natural sciences. Sociology, economics, history, literature, the fine arts and the useful arts are well represented. Constant additions will be made to secure the latest and best works in the several departments of learning.

DINING HALL.

A colonial dining hall, built of brick and equipped with all modern conveniences, was completed and opened February, 1903, for the accommodation of students. A committee composed of two members of the faculty, two members of the student body, and the steward, manages the affairs of the dining hall.

The hall contains a number of suites of rooms which may be secured for occupancy by young women attending any of the departments of the college.

THE HEATING, LIGHTING AND POWER PLANT.

This plant is located in the ravine, near the chemical laboratory. It is equipped with two large boilers, an engine and an electric generator. Here steam is generated which heats the college buildings on the west side of the public highway, extending from the dining hall to the veterinary laboratory, and the horticultural building and botanic museum on the east side. Here also is produced the electricity which lights all the buildings and the grounds of the college. Electric power is also generated which is used to drive the machinery in the dairy and in the barn. Connected with the plant is a machine shop in which much work is done for the college. The plant affords opportunity for students in mechanical and electrical engineering to observe the modern utilization of steam and electricity.

EXPENSES.

Tuition. — Tuition is free to citizens of the United States. Citizens of Massachusetts, however, in accordance with an act of the Legislature, must make application to the Senator of the district in which they live for a free scholarship that covers the charge for tuition. Blank forms for such application may be obtained from the president of the college.

Rooms.—It is expected that students will occupy rooms in the college dormitories, unless excused to room elsewhere. For the information of those desiring to carpet their rooms, the following measurements are given: in the south dormitory the study rooms are about fifteen by fourteen feet, with a recess seven feet four inches by three feet; and the bedrooms are eleven feet two inches by eight feet five inches. In the north dormitory the corner rooms are fourteen by fifteen feet, and the annexed bedrooms eight by ten feet. The inside rooms are thirteen and one-half by fourteen and one-half feet, and the bedrooms eight by eight feet. All rooms are unfurnished. Mr. Thomas Canavan has the general superintendence of the dormitories, and all correspondence relative to the engaging of rooms should be with him.

Board. — Board at the new dining hall has been \$3.25 per week; in private families, \$4 to \$5.

Incidental Expenses. — The military suit must be obtained immediately upon entering college, and used in the drill exercises prescribed. The following fees, to be paid in advance, are applied towards the maintenance of the several laboratories: chemical, \$15 per semester used; zoölogical, \$2 per semester used sophomore year, other classes \$4 per semester; entomological, \$3 per semester used. The fee for use of the botanical laboratory for one period of two hours during each week is \$1 per semester; other periods will be charged for proportionally. Some expense is also incurred for text-books. In exceptional cases incidental expenses necessitate additional charges.

Room rent, in	advai	nce,						\$15	00	\$45 00

							-			
								\$2 20	50	\$ 300 00

In addition to the above expenses, \$120 tuition is charged to foreigners.

SCHOLARSHIPS.

ESTABLISHED BY PRIVATE INDIVIDUALS.

Mary Robinson Fund of one thousand dollars, the bequest of Miss Mary Robinson of Medfield.

Whiting Street Fund of one thousand dollars, the bequest of Whiting Street, Esq., of Northampton.

Henry Gassett Fund of one thousand dollars, the bequest of Henry Gassett, Esq., of North Weymouth.

The income of the above funds is assigned by the faculty to worthy students requiring aid.

Congressional Scholarships.

The trustees voted in January, 1878, to establish one free scholarship for each of the congressional districts of the State. Application for such scholarships should be made to the representative from the district to which the applicant belongs. The

selection for these scholarships will be determined as each member of Congress may prefer; but, where several applications are sent in from the same district, a competitive examination would seem to be desirable. Applicants should be good scholars, of vigorous constitution, and should enter college with the intention of remaining through the course.

STATE SCHOLARSHIPS.

The Legislature of 1883 passed the following resolve in favor of the Massachusetts Agricultural College:—

Resolved, That there shall be paid annually, for the term of four years, from the treasury of the Commonwealth to the treasurer of the Massachusetts Agricultural College, the sum of ten thousand dollars, to enable the trustees of said college to provide for the students of said institution the theoretical and practical education required by its charter and the law of the United States relating thereto.

Resolved, That annually for the term of four years eighty free scholarships be and hereby are established at the Massachusetts Agricultural College, the same to be given by appointment to persons in this Commonwealth, after a competitive examination, under rules prescribed by the president of the college, at such time and place as the senator then in office from each district shall designate; and the said scholarships shall be assigned equally to each senatorial district. But, if there shall be less than two successful applicants for scholarships from any senatorial district, such scholarships may be distributed by the president of the college equally among the other districts, as nearly as possible; but no applicant shall be entitled to a scholarship unless he shall pass an examination in accordance with the rules to be established as hereinbefore provided.

The Legislature of 1886 passed the following resolve, making perpetual the scholarships established:—

Resolved, That annually the scholarships established by chapter fortysix of the resolves of the year eighteen hundred and eighty-three be given and continued in accordance with the provisions of said chapter.

In accordance with these resolves, any one desiring admission to the college can apply to the senator from his district for a scholarship. Blank forms of application will be furnished by the president.

THE STATE LABOR FUND.

The object of this fund, five thousand dollars appropriated annually by the State, is to assist those Massachusetts students who are dependent either wholly or in part on their own exertions, by furnishing them work in the several departments of the college. The greatest opportunity for such work is found in the agricultural and horticultural departments. Application should be made to Profs. William P. Brooks and Frank A. Waugh, respectively in charge of said departments. Students desiring to avail themselves of its benefits must bring a certificate signed by one of the selectmen of the town in which they are resident, certifying to the fact that they require aid.

ENDOWED LABOR FUND.

There is available also the income of five thousand dollars, the gift of a generous friend of the college, which will be used in payment for labor of deserving students needing assistance.

PRIZES.

BURNHAM RHETORICAL PRIZES.

These prizes are awarded for excellence in declamation, and are open to competition, under certain restrictions, to members of the sophomore and freshman classes.

FLINT PRIZES.

Mr. Charles L. Flint of the class of 1881 established two prizes, one of thirty dollars and another of twenty dollars, to be awarded, at an appointed time during commencement week, to the two members of the junior class who may produce the best orations. Excellence in both composition and delivery is considered in making the award.

Notwithstanding the death of Mr. Flint, these prizes will be continued under the name of the Flint prizes.

GRINNELL AGRICULTURAL PRIZES.

Hon. William Claffin of Boston has given the sum of one thousand dollars for the endowment of a first and second prize, to be called the Grinnell agricultural prizes, in honor of George B. Grinnell, Esq., of New York. These two prizes are to be paid in cash to those two members of the graduating class who may pass the best written and oral examination in theoretical and practical agriculture.

HILLS BOTANICAL PRIZES.

The Hills prizes of thirty-five dollars, given by the late Henry F. Hills of Amherst, will this year be awarded to members of the senior class as follows: fifteen dollars for the best general herbarium; ten dollars for the best collection of Massachusetts trees and shrubs; and ten dollars for the best collection of Massachusetts woods.

J. D. W. FRENCH PRIZE.

Offered by the Bay State Agricultural Society to the members of the senior class for the best essay on forestry. Twenty-five dollars, to be called the J. D. W. French prize, in honor of the late J. D. W. French, formerly a trustee of the college, and one of the very earliest movers in favor of improved forestry management in New England.

Western Alumni Prize.

Twenty-five dollars, to be awarded at the end of sophomore year to that member of the sophomore class who during his two years in college has shown the greatest improvement in scholarship, character and example. Offered by the Western Alumni Association.

FORESTRY PRIZE.

Two prizes, fifteen and ten dollars, offered to those members of the senior and junior classes who prepare the best essays on the management of the farm woodlot. Given by an anonymous friend.

WINTER COURSE PRIZES.

The dairy prizes, given by the Massachusetts Society for Promoting Agriculture, to members of the short winter course. Two sets of prizes are offered: the first set consists of three prizes of fifty, thirty and twenty dollars, respectively, given for general

excellence in all branches of the course as offered; the second set consists of three prizes of twenty-five, fifteen and ten dollars, respectively, for excellence in the making of butter.

AWARD OF PRIZES, 1905.

Grinnell Agricultural Prizes (Senior). — First prize, Bertram Tupper; second prize, Harold Foss Tompson.

Hills Botanical Prizes (Senior).—Best herbarium, Esther Cowles Cushman; best collection of Massachusetts trees and shrubs, Esther Cowles Cushman; best collection of Massachusetts woods, Chester Leland Whitaker.

Flint Oratorical Prizes (Junior). — First and second prizes equally divided between Ralph Ware Peakes and William Hunlie Craighead.

Burnham Essay Prizes (Sophomore). — First prize, Waldo Darius Barlow; second prize, Clinton King; third prize, Joseph Otis Chapman.

Burnham Declamation Prizes (Freshman). — First prize, Thomas Francis Waugh; second prize, Allan Dana Farrar.

Western Alumni Improvement Prize (Sophomore). — Henry Tyler Pierce.

Military Honors (Senior). — The following cadets were reported to the Adjutant-General, U. S. A., and to the Adjutant-General of Massachusetts, as having shown special aptitude for military service: George Howard Allen, Edwin White Newhall. Jr., Frederick Loring Yeaw.

Dairy Prizes (Winter Course Students). — Massachusetts Society for Promoting Agriculture: for general excellence, first prize, William Everett Salmon; second prize, Charles Mason Carruth; third prize, Eugen Alfons Richard Schmitz.

Massachusetts Society for Promoting Agriculture: for highest scoring butter, first prize, Cecil Norman Victor Greenhalgh; second prize, John Baptiste Lucia, Jr.; third prize, Harry Rufus Carter.

Massachusetts Society for Promoting Agriculture: for excellence in stock judging, first prize, Morey Ambios Smith; second prize, Charles Mason Carruth; third prize, William Henry Ranney; fourth prize, Robert Edgar Pomeroy.

Special prize, offered by W. H. Bowker of Boston, for best knowledge of the use of fertilizers on the farm, one-half ton Stockbridge fertilizer, Eugen Alfons Richard Schmitz. Special prize, given by B. von Herff of New York, for best knowledge of the use of fertilizers on grass lands, Oliver Horace Gates.

RELIGIOUS SERVICES.

Chapel services are held every week day at 8 A.M. Further opportunities for moral and religious culture are afforded by Bible classes taught by one of the professors and other teachers for an hour every Sunday afternoon, and by a religious meeting Thursday evening under the auspices of the College Young Men's Christian Association.

LOCATION.

Amherst is on the New London Northern Railroad, connecting at Palmer with the Boston & Albany Railroad, and at Millers Falls with the Fitchburg Railroad. It is also on the Central Massachusetts Railroad, connecting at Northampton with the Connecticut River Railroad and with the New Haven & Northampton Railroad.

The college buildings are on a healthful site, commanding one of the finest views in New England. The large farm of four hundred acres, with its varied surface and native forests, gives the student the freedom and quiet of a country home.

FARM REPORT.

The farm operations for the past year have been about the same as in years before. The principal crops have been hay, potatoes, corn and celery, with small lots of carrots and mangels.

The spring season was very dry, enabling us to work our land very early. The oats and peas were sown April 18, and potatoes were planted by April 26. Both crops came up nicely and looked well throughout the season.

Spraying the potatoes was begun June 3, followed by sprayings June 9 and 24, July 3 and 7, leaving two rows through the middle of the piece unsprayed for a check. The tops on these rows stood up equally as well as those sprayed, and not until after we began to dig the potatoes did we see the benefits of our spraying. A sprayed row gave on the average one-sixth more potatoes than one unsprayed. The formula used was the 6, 4, 50.

The continued dry weather gave us a chance to keep at work on our corn ground, so that we were able to finish planting by May 20. This early planting did not prove very successful, as much of the corn failed to germinate, and second planting had to be resorted to.

Three varieties of corn were received from the Department of Agriculture at Washington, namely, Selection 78, Hybrid 68 and Department of Agriculture Leaming. These varieties were the last to be planted, and were given the very best of culture. The first two failed to make any stand, and the ground had to be harrowed and planted over; the third had to be planted over by hand, but proved a little better than the others.

Twenty-one acres of corn land were seeded down this year.

LIVE STOCK.

The kinds and numbers of the several classes of live stock are shown below:—

Horses. — French Coach, 1 stallion, 3 mares, 2 fillies; Percheron, 1 stallion; German Coach, 1 mare; French Coach, half-blood, 2 colts; Percheron, three-fourths blood, 2 mares, 1 colt; work horses, 5.

Neat Cattle. — Jersey, 2 calves, 2 cows; Ayrshire, 3 calves; 7 cows; Holstein-Friesian, 1 bull, 7 cows; total, 22 head.

Sheep. — Southdown, 7 breeding bucks, 48 ewes, 7 lambs; total, 62 head.

Swine. — Berkshire, 1 boar, 4 sows; Yorkshire, 1 boar, 11 sows; total, 17 head.

The stock is all making very satisfactory progress. Owing to the loss by fire of two months' milk records, we are unable to give a yearly statement of the milk product, but suffice it to say the herd has done better than last year.

THE FARM FINANCES.

The cash receipts for the year are \$10,757.04, and there is due on account of sales made during the year over and above bills payable the sum of \$194.65. This added to the cash receipts makes a total of \$10,951.69,—an increase of \$4,191.37 over last year. The inventory at the present time is \$12,931.18; to this add the inventory of loss by fire, \$10,645.23, making a total of \$23,576.41,—an increase of \$5,663.83 over last year's inventory. This increase of \$5,663.83 added to cash receipts makes a total of \$16,615.52; from this deduct the total expenses for the year, or \$16,390.98, and we have a balance of \$224.54 to credit to the farm.

The cash received during the year has been derived from the following sources: for milk and cream, \$4,492.22; cattle, \$2,019.30; horses, including fees for the use of stallions, \$435.95; swine, \$937; sheep, \$261.36; hay, \$38.90; potatoes, \$372.81; celery, \$139.83; labor, \$1,402.58; sundries, \$657.09.

E. H. FORRISTALL,

Superintendent.

MILITARY DEPARTMENT.

Acting President Wm. P. Brooks, Massachusetts Agricultural College.

SIR:—I have the honor to submit the following report of the military department of this college for the year ending Dec. 31, 1905.

I have been in charge of the department of military science and factics since September, 1905, under Special Order, No. 195, War Department, dated Washington, D. C., Aug. 23, 1905. The instruction has been both theoretical and practical, and conducted in compliance with college regulations and War Department orders.

Under the provisions of General Orders, No. 101, War Department, 1905, this instruction is graded, in respect to the military course, as of the second class, "B," requiring the following minimum of exercises, viz.:—

At every institution of Class B, at which a professor of military science and tactics is detailed, it shall be provided in its regular schedule of studies that at least three hours per week for two years, or the equivalent thereof, shall be assigned for instruction in the military department, not less than two-thirds of the total time to be devoted to practical drill, including guard mounting and other military ceremonies, and the remainder to theoretical instruction.

The character of instruction will vary according to the nature of the institutions and the facilities afforded; but instruction of classes A, B, and C shall include practical instruction in the following subjects:—

Infantry drill regulations.

Field service regulations.

Manual of guard duty.

Firing regulations for small arms.

Theoretical instruction shall include the portions of the above subjects covered by the practical instruction, and may be supplemented by lectures.

The above requirements of the War Department have been strictly complied with since the college opened in September, and additional drills have been given in "Butts' Manual of Physical Drills," and in artillery drill. Lectures, though not now required, have been given on military subjects. Only seniors and freshmen have been required to take theoretical instruction, each class once per week.

Up to June 29, 1905, General Order, No. 65, War Department, dated April 6, 1904, governed in this department, and required the following:—

(a) Practical: -

Infantry drill regulations, through the school of the battalion in close and extended order.

Advance and rear guards and outposts.

Marches.

The ceremonies of battalion review, inspection, parades, guard mounting and escort of the colors.

Infantry target practice.

Instruction in first aid to the injured.

Weather permitting, there shall be not less than one parade and five guard mounts during each week of the school term, and one battalion inspection and review each month.

In no case shall target practice, to the extent permitted by the allowance of ammunition, be omitted during the school year except on authority given in each case by the Secretary of War.

(b) Theoretical: -

(1) Infantry drill regulations; (2) the manual of guard duty; (3) small arms firing regulations; (4) army regulations and articles of war; (5) the following records: enlistment and discharge papers, descriptive lists, morning reports, field and monthly returns, requisition and property returns; (6) lectures: one on the organization of the United States Army, one on patrols and outposts, one on camps and camp hygiene, three on lines and basis of operations, two on attack and defence of advance and rear guards, outposts and convoys.

Records of this department show above order to have been complied with except as to number of guard mounts and target practice, it being necessary to reduce guard mounts to four per week, and to limit the number of students taking target practice.

As arranged at present, military exercises are conducted in accordance with the following schedule, viz.:—

Monday, recitation of seniors, 5 P.M.; drill, 3.45 P.M.

Tuesdays, the same practical instruction as for Mondays.

Thursdays, drill at 3.45 p.m.; recitation of freshmen, 2.30 p.m. Saturdays, inspection of dormitories, including students' rooms, 8.30 A.M.; instruction in guard duty and duties of sentinels, 8.15 to 10.15 A.M. The latter exercise is required only of

those students who have incurred demerits in the military department, such as unauthorized absence from drill or inspection, or room not in proper order.

Drills are both in close and extended order; target practice by squad during the drill order hour; battalion drills are usually preceded by parade and review.

The order of drill commences with small squads in the school of the soldier, and proceeds step by step, with and without arms, until the freshmen become proficient, when they are assigned to the companies, after which the exercises include all movements in company and battalion drill.

The drills are varied as much as consistent with official regulations, to embrace field artillery; gallery practice; firing (indoors) at an iron target with a reduced charge of powder, two grains; and "Butts' Manual of Physical Drill," the latter in the drill hall during the winter months, and when the weather is too inclement to drill out of doors.

One hundred and twenty-four students have had target practice during the past year at short ranges, with the Springfield cadet rifle; fair progress has been made, but much more might have been accomplished with more time. This is a subject of greatest importance, which calls for more time than the schedule permits, but which cannot be remedied without encroaching upon the other departments considered equally important. Only one hour of target practice each regular drill day, during which only a few students can take part, is of little or no benefit. To become a good marksman requires a careful study of the mechanism of the rifle; frequent practice upon the rifle range under various conditions of weather, and daily practice for a few minutes each day in the sighting; pointing and aiming drills for at least a month before going to the range; also gallery practice.

If target practice is to be continued, I strongly recommend that at least two more targets be erected; and, if it is possible, that some provision be made by the State whereby tentage and camp equipage be provided which would enable the whole student body to go into camp for one week in each college year, the time to be given to instruction in guard and outpost duty, target practice, construction of shelter trenches, etc. If this cannot be done, I would suggest the erection of one more target, and restrict target practice to the junior and sophomore classes. As conducted at present, target practice is of little value, and is not much more than a waste of time and ammunition.

The band, under the leadership of Stanley Sawyer Rogers, member of the senior class, is doing good work, and merits all the encouragement that has been given it in the way of appropriations. During the winter it will play for the drills in "Butts' Manual."

All the buildings under my supervision are in good condition, except that the drill hall is greatly in need of a slate roof. This recommendation has been embraced in previous reports. The plumbing in all the buildings, as far as I can ascertain, is in good sanitary condition. It was with difficulty that the drill hall was saved during the recent burning of the college barn, owing to its shingled roof.

Under the provisions of General Orders, No. 65, War Department, 1904, the following-named students of the class of 1905 were reported to the Military Secretary of the Army and the Adjutant-General of the Commonwealth as having shown special aptitude in military exercises, viz.: George H. Allen, Frederick L. Yeaw, Edwin W. Newhall.

During a recent wind storm the college flagstaff was blown down and rendered unfit for further use. I would recommend that a new one of steel be erected, similar to the one in the town of Amherst.

Under the provisions of General Orders, No. 101, War Department, dated June 29, 1905, I quote the following:—

The reports of the regular inspection of the colleges and schools to which officers of the army are detailed as professors of military science and tactics will hereafter be submitted annually to the general staff for its critical examinations; and the chief of staff shall report to the Secretary of War from the institutions which have maintained a high standard the six whose students have exhibited the greatest application and proficiency in military training and knowledge.

The President of the United States authorizes the announcement that an appointment as second lieutenant in the regular army will be awarded annually to an honor graduate of each of the six institutions thus designated, provided that sufficient vacancies exist after the appointment of graduates of the Military Academy at West Point and the successful competitors in the annual examination of enlisted men. By the term honor graduate is understood a graduate whose attainments in scholarship have been so marked as to receive the approbation of the president of the school or college, and whose proficiency in military training and knowledge and intelligent attention to duty have merited the approbation of the professor of military science and tactics.

This has been the rule for the past two years, but up to date no Agricultural College, Class B, has received such an appointment. I believe this to be due entirely to the limited amount of time that can be given to the military department at institutions of Class B. Thus far all appointments provided for in above order have gone to institutions of Class A and Class C, schools that are essentially military schools, and where a great amount of time is devoted to the military department. I do not believe Class B institutions can compete with those of Class A and Class C in the military department.

Inasmuch as there are 45 Class B institutions and only 40 of Class A and Class C that are affected by above order, it would seem to me a better arrangement if at least two of the above appointments could go to Class B institutions, and thus create competition among them in military work. This, in my opinion, is a prize of great value, well worth striving for, and should inspire the ambition of every student. I make the above suggestion, hoping it may bear fruit by way of recommendation to War Department, which will lead to giving Class B institutions the above suggested two appointments.

The following is a list of ordnance and ordnance stores, property of the United States, in possession of the college:—

- 2 3.2-inch breech-loading steel guns, with implements complete.
- 2 8-inch mortars, with implements.
- 2 mortar beds.
- 2 carriages and limbers for 3.2 B. L. steel rifles.
- 147 Springfield cadet rifles, model 1884.
- 147 sets infantry accourrements.
 - 51 headless shell extractors.
 - 1 set reloading tools.
 - 6 non-commissioned officers' swords, steel scabbards.
- 14 non-commissioned officers' waist belts and plates.
- 14 sliding frogs for waist belts.
- 100 blank cartridges for field guns.
- 5,000 metallic rifle ball cartridges, calibre 45.
- 4,000 metallic blank cartridges, calibre 45.
 - 300 friction primers, radical, for field guns.
- 18,000 cartridge primers, small arms.
- 9,000 round balls for gallery practice.
 - 35 pounds of powder for small arms reloading.
- 7,000 pasters, white and black.
 - 100 paper targets, "A" and "B."
 - 1 set of marking rods, disks and brushes for gallery practice.

All of this property is in good condition and well cared for. Two hundred and seventeen students have received practical instruction in the military department during the year, some for only a short period, on account of not remaining in college. These figures include the class of 1905.

The organization at present is as follows: one battalion of two infantry companies, which, for the purpose of battalion drill and ceremonies, are equalized into four companies and the band.

Commandant.

Capt. George Chipman Martin, . . Eighteenth U. S. Infantry.

Staff.

Cadet Adjutant, .		CLARENCE ELLSWORTH HOOD.
Cadet Quartermaster,		Addison Tyler Hastings, Jr.
Cadet Sergeant Major,		GEORGE WARREN SLEEPER.
Cadet Ordnance Sergeant,		JOHN NICHOLAS SUMMERS.
Cadet Color Sergeant,		CHARLES ALMON TIRRELL.
Cadet Color Sergeant,		HENRY MERWIN RUSSELL.

Company A.

Cadet Captain,		HERMAN AUGUSTUS SUHLKE.
Cadet First Lieutenant,		FRY CIVILLE PRAY.
Cadet Second Lieutenant,		BENJAMIN STRAIN.
Cadet First Sergeant, .		WILLIAM OTIS TAFT.
Cadet Sergeant,		WALTER EBENEZER DICKINSON.
Cadet Sergeant,		FRANCIS DALLAS WHOLLEY.
Cadet Sergeant,		EDWIN DANIELS PHILBRICK
Cadet Sergeant,		CLIFTON HARLAND CHADWICK.
Cadet Corporal,		HENRY TYLER PIERCE.
Cadet Corporal,		HAROLD EDWARD ALLEY.
Cadet Corporal,		HARRY BURTON FILER
Cadet Corporal,		WILLIAM HUNLIE CRAIGHEAD.
Cadet Corporal,		HERBERT POLAND WOOD.
Cadet Corporal,		RAYMOND DEAN WHITMARSH.
Cadet Corporal,		MARCUS METCALF BROWNE.
Cadet Corporal,		CHESTER SOCRATES GILLETTE.
ouder corporation	•	CILLULATIO CIMBELLE

Privates, 62; aggregate, 78.

Company B.

Cadet Captain,		GEORGE TALBOT FRENCH.
Cadet First Lieutenant,		DANIEL HENRY CAREY.
Cadet Second Lieutenan		ALEXANDER HENRY MOORE WOOD
Cadet First Sergeant,		ARTHUR WILLIAM HALL, Jr.
Cadet Sergeant,		FREDERICK CHARLES PETERS.
Cadet Sergeant,		WAYLAND FAIRBANKS CHACE.
Cadet Sergeant,		EDWIN FRANCIS GASKILL.
Cadet Sergeant,		RICHARD WELLINGTON.
Cadet Corporal,		EDWIN HOBART SCOTT.

Cadet Corporal, . . John Thomas Caruthers. Cadet Corporal, . . JAMES HENRY WALKER. Cadet Corporal, . . Clifford Briggs Thompson. Cadet Corporal, . . JOSEPH OTIS CHAPMAN. Cadet Corporal, . . CLINTON KING.

Cadet Corporal, . . RALPH JEROME WATTS. Cadet Corporal, . . Thomas Addis Barry.

Privates, 62; aggregate, 78.

Rand.

Cadet First Lieutenant. . STANLEY SAWYER ROGERS. Cadet First Sergeant, . RALPH WARE PEAKES. Cadet Sergeant, . . Louis Hale Moseley. Cadet Corporal, . . EVERETT PIKE MUDGE. Cadet Corporal, . . FRANK HENRY KENNEDY.

Privates, 17; aggregate, 22.

Total in military department: 2 captains, 5 first lieutenants, 2 second lieutenants, 1 sergeant major, 1 ordnance sergeant, 2 color sergeants, 3 first sergeants, 9 sergeants, 18 corporals, 141 privates, aggregate 184.

Respectfully submitted,

GEORGE CHIPMAN MARTIN,

Captain, Eighteenth United States Infantry, Commandant.

REPORT OF THE DIRECTOR.

WILLIAM P. BROOKS, DIRECTOR.

The work of the Hatch Experiment Station during the past year has progressed under favorable conditions. The only changes in the station staff have been a few affecting minor positions, which are elsewhere referred to. There has accordingly been no interruption in the lines of investigation which have been in progress.

Besides the monthly meteorological bulletins, during the past year four other bulletins have been issued: Nos. 103 and 104 on the subject of fertilizers and the results of analyses thereof; No. 105 on tomatoes under glass and methods of pruning tomatoes; and No. 106 on condimental stock and poultry foods.

The work of the section of our division of chemistry having to do with fertilizers shows that the conditions of the fertilizer trade in the State are substantially the same as during recent years. The manufacturers and dealers still offer an enormous number of different brands of so-called complete and special fertilizers in the markets. The number of samples analyzed during the past year is 511, representing 313 distinct brands. There can be no doubt that the business of manufacturing and selling fertilizers might easily be greatly simplified; that a great reduction in the number of brands offered, without loss in any direction, is possible; and that the result of such simplification and reduction in the number of brands would be that fertilizers sufficiently varied for every purpose could be furnished to the farmers at lower prices than those at present prevailing.

The fertilizer section of our division of chemistry has during the past year analyzed the usual number of samples of miscellaneous materials, wood ashes, lime ashes, soils, etc. Such samples as are sent in by the farmers are usually analyzed and the results reported without charge.

The bulletin on tomatoes under glass is an important contribution to knowledge on the best methods of handling this crop, which is coming to be one of much importance in this State. Bulletin No. 106, on condimental stock and poultry foods, presents analyses of a large number of foods coming under these classes. It discusses the utility of such foods, and their cost as compared with the more common food It is clearly shown that their cost is in excess of what appears to be a perfectly fair estimate of their value. The bulletin presents a brief résumé of the results of experiments in the use of stock and poultry foods, which tends to show that the claims made for these foods are not justified by facts. The results of an experiment in the department of foods and feeding are presented and discussed, the conclusion being that the food under trial (Pratt's) did not appear to be superior in any way to a like mixture of corn meal and wheat middlings, while the cost was considerably greater.

In the division of foods and feeding, under Dr. J. B. Lindsey, a number of other important lines of investigation have been followed during the year. A somewhat full statement of the results in a number of these will be found in Dr. Lindsey's report, which is transmitted herewith. Among the more important results of these investigations are the following points: Bibby's dairy cake, a food which has been persistently urged upon the attention of our milk producers, has been carefully tested, but has been found to be less satisfactory from an economical point of view than some of the ordinary food stuffs.

Eureka corn has been carefully compared with Sibley's Pride of the North corn, from the standpoint both of production and of food value. It is found that, although the Eureka gives a much heavier yield, the excess in weight is made up almost exclusively of water. The food value of the product of an acre of Eureka corn is not equal to the food value of the much smaller acre product of Sibley's Pride of the North.

Wheat bran has been compared with corn silage, in connection in both cases with some of the more nitrogenous concentrates, as food for milch cows. The results indicate that silage is equally as satisfactory as the bran, and that by substitution of silage for the bran the necessary outlay for purchased foods in milk production can be greatly reduced.

This division has carried out an interesting investigation into the conditions prevailing in milk production in Amherst and neighboring towns. It is found that the conditions are often quite unsanitary; that bacteria are frequently exceedingly numerous in the milk, indicating improper methods of handling; and that in general there is urgent need of improvement. In the judgment of Dr. Lindsey, the results of this investigation indicate the desirability of the establishment of some regular system of inspecting dairies. It is believed that this is something which consumers in increasing numbers will be likely to insist upon in the near future.

In the horticultural division the only investigation sufficiently advanced to justify report is that undertaken, and in part reported upon in our last annual report, on methods of pruning peach trees injured by winter-killing. It will be remembered that four systems were under trial: no pruning, light pruning, moderate pruning, and severe pruning. Severe pruning consisted in removing nearly all the branches of the injured tree. The observations of another year lead to the conclusion that this system cannot be recommended. A more moderate pruning, consisting of the removal of from one-third to one-half of the growth of the previous year, seems to have given results which are on the whole most satisfactory; and such pruning is recommended in all cases when the wood has been injured by winter-killing. the fruit buds have been destroyed by the winter, it is recommended to prune back the previous season's growth severely, leaving only two or three buds.

In the entomological division, experiments are in progress with a view to determining the definite strength of hydrocyanic acid gas which can be used with safety on plants in greenhouses under varying conditions of growth. In the report of the division of botany and vegetable pathology will be found a discussion of the general conditions as affecting plant diseases during the past year; references to the somewhat unusual attack of the potato rot fungus (*Phytopthora infestans*) on the tomato; and a discussion of the causes of sun scald and the browning of the foliage of conifers and other evergreens.

The report of the vegetable pathologist, Dr. George E. Stone, includes also a suggestive discussion on winter-killing as affecting trees and shrubs, as a result of the exceptionally cold winters 1902–03 and 1903–04.

The great importance of suitable aeration of the soil for perfect germination of certain seeds is brought out by another paper. The effects of sterilization of soils respectively rich and low in organic matter on germination and the growth of plants have been investigated. It has been found that, if the soil is rich in organic matter, sterilization is favorable both to germination and subsequent growth; but if the soil contains little organic matter, such treatment is unfavorable.

The influence of treating seeds in soil decoctions of varying strengths has been carefully studied, and it is shown that such decoctions from sterilized soil when highly diluted exercise a favorable effect on germination. The report of Dr. Stone includes also the presentation and discussion of results of various methods of seed selection. The conclusion is that, for seeds adapted to that method of handling, the use of sieves of suitable mesh as a means of separating the small and inferior seeds is strongly to be recommended. The use of other methods of separation in the case of seeds which cannot be successfully handled by sifting is urged, as being of much importance.

The work of the agricultural division during the past year has followed the usual lines, and is elsewhere briefly summarized.

Among the different bulletins and reports which have been issued by the station, the following are still in stock and can be furnished on demand:—

- No. 3. Tuberculosis.
- No. 27. Tuberculosis in college herd; tuberculin in diagnosis; bovine rabies; poisoning by nitrate of soda.
- No. 33. Glossary of fodder terms.
- No. 41. On the use of tuberculin (translated from Dr. Bang).
- No. 64. Analyses of concentrated feed stuffs.
- No. 67. Grass thrips; treatment for thrips in greenhouses.
- No. 75. Fertilizer analyses.
- No. 76. The imported elm-leaf beetle.
- No. 77. Fertilizer analyses.
- No. 81. Fertilizer analyses; treatment of barnyard manure with absorbents; trade values of fertilizing ingredients.
- No. 82. Orchard management; cover crops in orchards; pruning of orchards; report on fruits.
- No. 83. Fertilizer analyses.
- No. 84. Fertilizer analyses.
- No. 87. Cucumbers under glass.
- No. 89. Fertilizer analyses; ash analyses of plants; instructions regarding sampling of materials to be forwarded for analysis.
- No. 90. Fertilizer analyses.
- No. 92. Fertilizer analyses.
- No. 95. Fertilizer analyses; notes on barnyard manure; trade values of fertilizing ingredients.
- No. 96. Fungicides; insecticides; spraying calendar.
- No. 97. A farm wood lot.
- No. 98. Inspection of concentrates.
- No. 99. Dried molasses beet pulp; the nutrition of horses.
- No. 100. Fertilizer analyses; market values of fertilizing ingredients.
- No. 102. Analyses of manurial substances and fertilizers; market values of fertilizing ingredients.
- No. 103. Analyses of manurial substances; instructions regarding sampling of materials to be forwarded for analysis; instructions to manufactures, importers, agents and sellers of commercial fertilizers; discussion of trade values of fertilizing ingredients.
- No. 104. Analyses of manurial substances and licensed fertilizers; market values of fertilizing ingredients.
- No. 105. Tomatoes under glass; methods of pruning tomatoes.

No. 109. Condimental stock and poultry foods.

Special bulletin, — The coccid genera Chionaspis and Hemichionaspis.

Technical bulletin, No. 1, — Greenhouse Aleyrodes; strawberry Aleyrodes.

Technical bulletin, No. 2, — The graft union.

Index, 1888-95.

Annual reports, 1898, 1899, 1900, 1901, 1902, 1903, 1904, 1905, 1906.

Of most of the other bulletins a few copies remain, which can be supplied only to complete sets for libraries.

The co-operation and assistance of farmers, fruit growers and horticulturists, and all interested directly or indirectly in agriculture, are earnestly requested. Communications may be addressed to the "Hatch Experiment Station, Amherst, Mass."

I, Charles A. Gleason, duly appointed auditor of the corporation, do hereby certify that I have examined the accounts of the Hatch Experiment Station of the Massachusetts Agricultural College for the fiscal year ended June 30, 1905; that I have found the same well kept and classified as above; that the receipts for the year from the Treasurer of the United States are shown to have been \$15,000, and the corresponding disbursements \$15,000; for all of which proper vouchers are on file and have been by me examined and found correct, thus leaving no balance of the \$15,000; and that \$3,737.66 are left of the State appropriation and of funds received from miscellaneous sources.

CHARLES A. GLEASON,

Auditor.

AMHERST, Aug. 7, 1905.

REPORT OF THE METEOROLOGIST.

J. E. OSTRANDER.

The attention of this division during the year has been largely confined to the work of making the usual observations of the various weather phenomena and a proper tabulation of these records, together with such computations as are found necessary for the purpose of comparison. The installation of some new apparatus has required some changes in the manner of tabulation, but the only effect on the results is to render them more accurate.

At the beginning of each month the usual bulletin of four pages has been issued, giving the more important daily records and monthly means, together with a summary of the results. The annual summary will be issued as a part of the December bulletin. In addition to issuing the bulletins, a considerable number of letters have been required to answer specific inquiries regarding rainfall, temperature and other features of the weather.

This station, being one of the voluntary observers' stations of the United States Weather Bureau, has furnished the section director at Boston with the usual monthly reports, and has also agreed to furnish the weekly snow reports during the winter. A phenological record has also been made, and a copy furnished the section director at his request.

The local forecast official at Boston has furnished this station with the local weather predictions daily except Sundays, and the proper signals have been displayed from the flagstaff on the tower. It was found necessary to shorten the flagstaff a few feet, but this has not resulted in making the signals less noticeable.

Owing to the unsatisfactory records made by some of the Draper self-recording instruments in the tower, it was decided to secure some of other make whose records would be more precise. Accordingly, a triple electric register for recording sunshine, rainfall and wind velocity was purchased from Julien P. Friez, and during the summer vacation the wiring was done to put it in working order. The sunshine recorder was mounted on top of the tower and connected by wires to the register in the tower. Two Edison primary batteries furnish the current required to operate the register at intervals of one minute while the sun is shining. A tippingbucket rain gauge on the campus is connected to the register in the tower by more than a thousand feet of wire, and each one-hundredth of an inch of rainfall is registered. furnishes a record of the rate of precipitation during a storm, as well as the total amount. The record is also checked by measurement in a standard rain gauge. A small anemometer of the Weather Bureau pattern was mounted on top of the tower in place of the Draper rain gauge, which was taken down, and each mile of wind travelled is recorded on the register below. As the drum on which all the abovementioned records are made travels at a rate of nearly three miles per hour, the records are very distinct, and variations in rate of wind movement, as well as in the rainfall, are easily noted. A set of maximum and minimum thermometers of the Weather Bureau pattern was purchased during the year, to replace others that were greatly worn.

The assistant observer, Mr. C. H. Chadwick, was advanced to the position of observer in June, succeeding Mr. G. W. Patch.

REPORT OF THE AGRICULTURISTS.

WM. P. BROOKS; ASSISTANTS, F. R. CHURCH, S. B. HASKELL.

The work of the agricultural department for the past year has closely followed the lines of recent years. The leading object of our work is, by long-continued comparative experiments, to throw light upon some of the many problems connected with the use of manures and fertilizers. results of a single year may be of value as a guide to practice, but it is important to know concerning any given system, not alone the immediate effect upon the crop, but the ultimate effect upon the soil as well. This is made manifest only by continued manuring along definite lines. long-continued comparison of different materials which may be used respectively as sources of any given plant food element, we may hope to determine their real and average relative value, and, by suitable rotation of crops, their relative suitability also for different plants. By continued experiment along definite lines in successive years we may hope, moreover, to discover the relation of season to the fertilizer efficiency of the different fertilizer materials under comparison. With definite knowledge concerning immediate effect upon the crop, ultimate effect upon the soil and differences in effect due to variations in seasons, we shall be in a position to give advice of value both to the farmer seeking to produce crops at lowest cost and to the fertilizer manufacturer. The work carried on in the department during the past season has involved the care of 244 field plots in our various fertilizer and variety tests, 150 closed plots and 245 pots in vegetation experiments. The work in the closed plots and the vegetation experiments serve as valuable checks upon the accuracy of field work, and enable us to extend the scope of our investigations. Besides the care for all this work, we have a grass garden including 48 species and 7 varieties, most of which occupy one square rod each. Our work with poultry has followed the general lines of investigation of earlier years, the principal subject under investigation being the relations of different foods and food combinations to egg production. A detailed report of results obtained will be at this time presented for but a small number of the experiments in progress.

The principal subjects of inquiry discussed, and the more important results, very briefly stated, are as follows:—

- I. To determine the relative value of barnyard manure, nitrate of soda, sulfate of ammonia and dried blood, as sources of nitrogen. The crop of this year was mixed oats and peas for hay; and, on the basis of yield, the nitrogen-furnishing materials rank in the following order: nitrate of soda, dried blood, sulfate of ammonia, and barnyard manure. On the basis of increase, as compared with no-nitrogen plots, taking into account all the crops grown since the experiment began, the materials rank as follows: nitrate of soda, 100 per cent.; dried blood, 68.72 per cent.; sulfate of ammonia, 60.78 per cent.; barnyard manure, 80.58 per cent.
- II. To determine the relative value of muriate as compared with high-grade sulfate of potash for field crops. The results of this year indicate the sulfate to be superior to the muriate for clover, for rhubarb, and for blackberries.
- III. To determine the relative value of different potash salts for field crops. The salts under comparison are high-grade sulfate, low-grade sulfate, kainite, muriate, nitrate, carbonate, and silicate. The crop of this year was soy beans. The different potash salts rank in the following order: carbonate, high-grade sulfate, silicate, nitrate, muriate, low-grade sulfate, and kainite. The crop where the latter salt was used was by far the poorest in the field, being much lower than the crop of the plots to which no potash has been applied for the past eight years.
- IV. To determine the relative value in crop production of a fertilizer mixture rich in potash, as compared with one

representing the average of special corn fertilizers purchasable in our markets. The crop of this year was hay,—mixed timothy, red-top and clovers. The crops were substantially equal; but, as the cost of fertilizers is lower where the fertilizer richer in potash is used, the advantage is with that combination of materials.

- V.—To determine the relative value in corn and hay production of a moderate application of manure alone, as compared with a smaller application of manure used in combination with 160 pounds of high-grade sulfate of potash per acre. The crop of this year was hay, mixed timothy, red-top and clovers. The larger average yield was produced on the combination of manure and potash; and, as this combination costs \$6.40 less per acre than the larger quantity of manure alone, the advantage in favor of the combination is decisive.
- VI. To determine which is better economy, to spread manure as hauled from the stable during the winter, or to place in a large heap to be spread in spring. This experiment occupies five pairs of plots. The spring application gave the better yield in all eases, but the difference was not sufficiently large to cover the larger cost of the extra handling involved in the case of the manure spread in the spring. The winter of 1904–05, however, was exceptionally favorable to good results from application at that season, as there was little or no wash over the surface.
- VII. To determine the economic result of using in rotation on grass lands: the first year, barnyard manure, 8,000 pounds per acre; the second year, wood ashes, 1 ton per acre; and the third year, bone meal, 600, and muriate of potash, 200, pounds per acre. The average yield of hay during the past season, all three systems of manuring being represented, on a total area of about 9 acres, is at the rate of about 4,840 pounds of hay per acre. The average for the thirteen years during which the experiment has continued, 1893–1905, inclusive, is 6,479 pounds.
- VIII. To determine whether the application of nitrate of soda after the harvesting of the first crop will give a profitable increase in the rowen crop. The increases produced

in the four pairs of plots under comparison were relatively small except in one instance. Nitrate applied at the rate of 250 pounds per acre gave an apparent increase of nearly 1 ton of rowen, which is considerably more than sufficient to cover the cost of the nitrate.

IX.—To test the relative value for the production of garden crops of fertilizers supplying respectively nitrogen and potash, when used with manure. The nitrogen fertilizers compared are dried blood, nitrate of soda and sulfate of ammonia. The use of the nitrate is attended with the greatest profit. On the basis of total crops produced, the relative standing of the different nitrogen fertilizers is: for the early crops, nitrate of soda, 100 per cent.; dried blood, 95.67 per cent.; sulfate of ammonia, 63.08 per cent.; for the late crops, nitrate of soda, 100 per cent.; dried blood, 98.77 per cent.; sulfate of ammonia, 79.52 per cent.

The potash salts under comparison are high-grade sulfate and muriate. For the fifteen years the relative standing of these fertilizers is: for the early crops, sulfate of potash, 100 per cent.; muriate of potash, 94.66 per cent.; for the late crops, sulfate of potash, 97.9 per cent.; muriate of potash, 100 per cent.

- X.—To determine whether alfalfa is a profitable crop in Massachusetts. A large number of experiments tried during the past eight or ten years indicates that it is quite doubtful whether alfalfa can be successfully grown under our climatic conditions.
- XI. Comparison of different feeds and feed combinations furnishing the essential nutrients in varying proportions for laying hens. The results indicate corn to have superior merit among the different grains for the production of eggs, considered from the standpoint both of total number and economy of production. Rice is somewhat superior in number of eggs produced to corn, but the cost is so great as to render its use inexpedient.

I. — Manures and Fertilizers furnishing Nitrogen compared. (Field A.)

To make clear the plan of the experiment, which is continuous, I quote from the seventeenth annual report:—

The experiments in Field A have two principal objects in view: first, to compare the efficiency (as measured by crop production) of a few standard materials which may be used on the farm as sources of nitrogen; second, to determine to what extent the introduction of a legume will render the application of nitrogen to a succeeding crop of another family unneces-The field includes eleven plots of one-tenth acre each. A full description of the plan followed will be found in the twelfth annual report of the Hatch Experiment Station. materials furnishing nitrogen under comparison are barnyard manure, nitrate of soda, sulfate of ammonia and dried blood. With few and unimportant exceptions, each plot has been manured in the same way since 1890. All the plots annually receive equal and liberal amounts of materials supplying phosphoric acid and potash. Three plots in the field have had no nitrogen applied to them since 1884; the materials under comparison on the other plots in the field are applied in such quantities as to furnish nitrogen at the rate of 45 pounds per acre to each. Barnyard manure is applied to one plot, nitrate of soda to two, sulfate of ammonia to three and dried blood to The potash applied to these plots is supplied in the form of muriate to six plots, namely, 1, 3, 6, 7, 8 and 9. supplied in the form of low-grade sulfate to four plots, namely, 2, 4, 5 and 10.

The crops grown in this experiment previous to this year in the order of their succession have been: oats, rye, soy beans, oats, soy beans, oats, soy beans, oats, oats, clover, potatoes, soy beans, potatoes, soy beans, potatoes.

The condition of the soil of this field during the last year or two had indicated quite clearly that it would be benefited by liming. Freshly water-slaked lime was used. It was applied by the use of Kemp's manure spreader, adjusted with a view to applying lime as closely as possible at the rate of 1 ton to the acre. The amount actually applied to

1½0 acre was 2,395 pounds, so that the lime was used in slightly greater quantity than intended. The work of the spreader in applying lime is quite satisfactory. There is no difficulty in adjusting it to apply any desired amount with substantial accuracy. Any chance that the amounts applied to the different plots in such experiments as those in progress on Field A will differ is avoided by driving the spreader in applying the lime the full length of the field across the plots.

The crop of this year was oats and peas. The lime was applied on April 26, and plowed in, and Canada peas at the rate of 1½ bushels per acre were sown on April 28, and deeply harrowed in. On April 29 the fertilizers were applied, and harrowed in. The oats were of the Clydesdale variety. They were sown at the rate of 1 bushel to the acre on May 1, and harrowed in. No accidental conditions likely to interfere with the experiment were noted, although the rank growth on the plots receiving nitrogen in the most highly available form (nitrate of soda and sulfate of ammonia) resulted in considerable lodging, which no doubt decreased the yield on those plots.

The rates of yield on the several plots and the source of nitrogen on each are shown in the following table:—

Yield	of	Oats	and	Peas	per	Acre.
-------	----	------	-----	------	-----	-------

Plots	١.	Nitrogen Fertilizers used.										
0, .		Barnyard manure,					4,950					
1, .		Nitrate of soda (muriate of potash),					6,900					
2, .		Nitrate of soda (sulfate of potash),					7,000					
3, .		Dried blood (muriate of potash),					6,700					
١, .		No nitrogen (sulfate of potash),					4,350					
i, .	٠	Sulfate of ammonia (sulfate of potash), .					5,650					
3, .	٠	Sulfate of ammonia (muriate of potash), .					6,600					
7, .		No nitrogen (muriate of potash),					4,800					
8, .		Sulfate of ammonia (muriate of potash), .					6,900					
9, .		No nitrogen (muriate of potash),					3,900					
), .		Dried blood (sulfate of potash),			. •		6,500					

- It will be noticed that the yield on the three no-nitrogen plots (4,7,9) is much below the yield obtained on any of the plots where fertilizers supplying nitrogen were used. was a fair proportion of peas in the crop, but, in spite of the fact that peas are usually able to take a considerable proportion of their nitrogen from the air, it is very clear that it will be unwise, in the case of a mixed crop including a legume and a non-legume, to depend to any great extent upon this atmospheric source of supply. The average yield of the three no-nitrogen plots was at the rate of 4,350 pounds of The average yield of the nitrogen plots was hav per acre. at the rate of 6,400 pounds per acre. Here is a difference of a little more than 1 ton per acre, which is far more than sufficient to cover the cost, \$7.85, of the amounts in which such fertilizer was used. It will be noticed, further, that the yield on the plot to which barnyard manure is annually applied is much below that on even the poorest plot to which a nitrogen fertilizer was applied. The manure in question was put on at the time of preparing the soil in the spring, and evidently the nitrogen it contained did not become in large degree available in season to benefit crops making their growth so early in the growing season as oats and The average yields of this year on the several fertilizers are shown in the following table: —

FERTILIZERS USED.										
Average of the no-nitrogen plots (4, 7, 9),						4,350				
Average of the nitrate of soda plots (1, 2),						6,950				
Average of the dried-blood plots (3, 10),						6,600				
Average of the sulfate of ammonia plots (5, 6, 8),						6,383				

As the result of experiments previous to this year, it has been found that the materials furnishing nitrogen have produced crops in the following relative amounts:—

				Per Cent.
Nitrate of soda, .				100.00
Barnyard manure, .				96.02
Dried blood,				90.83
Sulfate of ammonia,				88.62
No nitrogen,				72.11

Similar averages for this year are as follows: —

				Per Cent.
Nitrate of soda, .				100.00
Dried blood,				94.96
Sulfate of ammonia,				91.84
Barnyard manure, .				71.22
No nitrogen,				62.60

Combining the results showing relative standing in 1905 with similar figures for all the years previous to 1905, the relative standing is as follows:—

				Per Cent.
Nitrate of soda, .				100.00
Barnyard manure, .				94.47
Dried blood,				91.09
Sulfate of ammonia,				88.83
No nitrogen,				71.52

The figures showing relative standing of the different materials furnishing nitrogen as compared with the nonitrogen plots so far given are based upon the total yield. If we compare the different materials used as sources of nitrogen on the basis of increase in crop rather than on the basis of total product, they rank to date for the entire period of the experiment, 1890 to 1905, inclusive, as follows:—

Relative Increases in Yields (Average for the Sixteen Years).

				Per Cent.
Nitrate of soda, .				100.00
Barnyard manure,				80.58
Dried blood,				68.72
Sulfate of ammonia,				60.78

Whatever the method of comparison, the superiority of the results obtained from the use of nitrate of soda is very apparent. In estimating the significance of the figures, the fact must not be lost sight of that the four different materials, nitrate, dried blood, sulfate of ammonia and barnyard manure, are applied in this experiment in amounts furnishing precisely equal quantities of nitrogen to each plot where they are used. At current prices, a pound of nitrogen can be purchased at lower cost in nitrate of soda than in almost any other material; and the advisability, therefore, of depending largely upon the nitrate as a means of supplying the important element nitrogen, becomes strikingly evident.

II. — THE RELATIVE VALUE OF MURIATE AND HIGH-GRADE SULFATE OF POTASH. (FIELD B.)

This experiment, which has been in progress since 1892, was designed to test the relative value of muriate and highgrade sulfate of potash used continuously upon the same These salts since 1900 have been annually applied at the rate of 250 pounds each per acre. There are ten plots in the field, each containing about 1/7 of an acre. Five of these receive muriate of potash, and these plots alternate with the same number of plots which are yearly manured with sulfate of potash. Each plot in the field is manured annually with fine-ground bone at the rate of 600 pounds per acre. The crops grown in this field this year have included soy beans, celery, asparagus, rhubarb, raspberries, blackberries and clovers. The yields of the three crops, asparagus, raspberries and blackberries, have been small, and the differences in the results on the different potash salts did not appear to be sufficient to be of much signifi-There was, however, a very marked difference in the extent to which the blackberry bushes on the two potash salts winter-killed. Those on the plot which has annually received an application of sulfate of potash were killed back much less seriously than the bushes on the muriate of potash plot. There was a marked difference in the growth of the celery on the two potash salts, that on the muriate being much better than that on the sulfate. This fact is reported at this time without comment, as it seems to the writer probable that some accidental cause, not connected directly with the system of manuring, unfavorably influenced the growth on the poorer plot. Six plots in the field have been. in clover during the past year. All of these plots were sown to clover in the late summer of 1904, one pair of plots each (muriate and sulfate) with Alsike, Medium and Mammoth clovers. The clover on all plots germinated well, but early showed a very unhealthy condition on the plots occupied both by the Medium and Mammoth red clovers. The young plants early turned yellow and gradually disappeared. So poor was the condition of these varieties of clover this

spring that it was decided to plow them up. The unhealthy condition is thought to have been connected with a deficiency of lime in the soil, and these plots accordingly received an application of freshly slaked lime at the rate of about 1 ton to the acre. They were then plowed and reseeded to the same varieties of clover. The crops were cut on August 11, but, being much mixed with weeds, as was to be expected in the case of spring-sown clover, the product was not weighed. The Alsike clover upon the plots sown in the summer of 1904 gave one fair crop.

The yield on the muriate was at the rate of 3,986 pounds per acre; on the sulfate, 4,000 pounds. These figures do not accurately indicate the relative condition of the clover, for the growth on both plots was somewhat mixed with other grasses, which were much more abundant on the muriate of potash than on the sulfate, where the clover was very clearly much superior to that on the other plot. The rhubarb on both potash salts gave a heavy growth. The rates of yield per acre were as follows:—

Muriate v. High-grade Sulfate of Potash (Rhubarb). — Yields per Acre (Pounds).

	Stalks.	Leaves.				
Muriate of potash,					23,148	19,249
Sulfate of potash,					23,729	20,344

These yields are much heavier than last year, as the rhubarb is now more fully established, and the difference in favor of the sulfate of potash is still greater than previously.

III. — Comparison of Different Potash Salts for Field Crops. (Field G.)

This experiment for comparison of different potash salts was begun in 1898. The field contains forty plots, of about one-fortieth of an acre each. The plots are fertilized in five series of eight plots each, each series including a no-potash plot and one plot for each of the potash salts under comparison. Those salts are kainite, high-grade sulfate, low-grade sulfate, muriate,

nitrate, carbonate and silicate. Each is applied annually to the same plot, and all are used in such amounts as to furnish equal potash to each plot. In the quantities employed the different salts supply annually actual potash at the rate of 165 pounds per acre. All plots are equally manured with materials furnishing fairly liberal amounts of nitrogen and phosphoric acid.

The crops grown in this experiment since 1898 in order of succession up to the present year have been:—

- 1898. Medium Green soy beans.
- 1899. Potatoes.
- 1900. Plots 1–8, cabbage; 9–24, Medium Green soy beans; 25–40, cow peas.
- 1901. 1-8, wheat; 9-40, corn.
- 1902. Clover.
- 1903. Clover.
- 1904. 1-16, cabbage; 17-40, corn.
- 1905. Soy beans.

The results with the crops of last year, cabbages and corn, were rather indecisive, and were not reported in detail. The most striking observation in connection with the results of last year was the relatively low yields on the silicate of potash and the relatively high yields on the nitrate and car-The crop in 1905 was the Medium Green sov bean. The season was favorable to the crop, which, with one exception, to be presently noted, appeared to be affected by no disturbing accidental conditions. A circular area, extending entirely across Plot 10 and a short distance into both plots 9 and 11, was early affected by some unknown cause, which within a relatively short time resulted in the death of the plants growing there. It is estimated that the total number of plants in Plot 10 thus destroyed was from one-quarter to one-third of the total number of plants in the plot. proportion of plants destroyed in plots 9 and 11 was relatively small.

At a period very early in the growth of the crop it was noticed that the leaves on all the plots to which kainite is applied as a fertilizer were abnormal. Practically all the

¹ Sixteenth annual report, Hatch Experiment Station.

leaves on plants on these plots early became very much crinkled. They were smaller than normal leaves, and there were numerous areas near the margins of some of the leaves where the tissues died. This appearance was repeated with such perfect regularity on each one of the plots (2, 10, 18, 26, 34) to which kainite was applied that it is impossible to doubt that the effect was due to constituents found in this fertilizer. It was clearly physiological in its origin. Whether due to the large amounts of chlorides contained in the kainite applied to these plots we are not at present certain; but, in view of the fact that potassium chloride has in a number of instances been shown to be distinctly inferior as a source of potash for soy beans in comparison with other salts in our experiments, it seems probable that such was the case. The potash salts used on the different plots and the rates of yield of beans per acre are shown in the following table: -

Yields per Acre.

Plots.				Рот	ASH	Beans (Bushels).	Straw (Pounds).			
1,			No potash,						24.14	2,120
2,			Kainite,						18.62	1,210
3,			High-grade	sulf	ate,				26.90	2,000
4,			Low-grade	sulfa	ate,				25.17	1,800
5,			Muriate,					.	22.41	1,640
6,			Nitrate,						24.14	1,960
7,			Carbonate,					.	32.41	2,280
8,			Silicate,						22.07	1,540
9,			No potash,					٠.	18.79	1,400
0,			Kainite,			٠.			11.38	1,600
1,			High-grade	sulf	ate,				21.04	2,080
2,			Low-grade	sulfa	ite,				22.42	2,280
3,			Muriate,						22.07	2,240
4,			Nitrate,						25.87	2,800
5,			Carbonate,						28.28	2,700
6,			Silicate,	•					26.90	2,740
7,			No potash,						24.83	2,380
8,			Kainite,						17.24	1,540
9,			High-grade	sulf	ate,				25.52	1,940

22,			Nitrate,						26.21	2,160
23,			Carbonate,						26.90	2,260
24,			Silicate,						26.21	2,080
25,			No potash,				٠.		22.41	1,780
26,			Kainite,						19 31	1,240
27,			High-grade	sul	fate,				31 72	2,080
28,		٠	Low-grade	sul	fate,				25.87	1,760
29,			Muriate,						24.48	1,900
30,			Nitrate,						15.86	1,240
31,			Carbonate,						26.55	1,960
32,			Silicate,						23.19	1,600
33,			No potash,						23.45	1,800
34,			Kainite,						18.26	1,160
35,			High-grade	sul	fate,				24.14	1,820
36,			Low-grade	sul	fate,				16.21	960
37,			Muriate,						15.52	1,040
38,			Nitrate,						24.83	2,020
39,			Carbonate,						24.14	2,240
10,			Silicate,						28.62	2,160

The influence of the different potash salts is somewhat more clearly brought out by the table below, which gives the average results for each of the potash salts employed:—

Soy Beans. — Average Yield per Acre.

Potash Salt.		Beans (Bushels).	Straw (Pounds)			
No potash (plots 1, 9, 17, 25, 33),	,				22.72	1,896
Kainite (plots 2, 10, 18, 26, 34),					16.96	1,350
High-grade sulfate (plots 3, 11, 19, 27,	35),	,			25.86	1,984
Low-grade sulfate (plots 4, 12, 20, 28,	36),				22.76	1,712
Muriate (plots 5, 13, 21, 29, 37),					23.03	1,728
Nitrate (plots 6, 14, 22, 30, 38),		,			23.38	2,036
Carbonate (plots 7, 15, 23, 31, 39),				.	27.86	2,288
Silicate (plots 8, 16, 24, 32, 40),					25.40	2,024

It will be noticed that the average rate of yield on all plots to which potash salts are applied, with the exception of those where kainite is the source of potash, is greater than on the no-potash plots. The average yield on the kainite, on the other hand, is much below the average on the no-potash plots. Examination of the longer table shows that this inferiority of kainite was constant for each of the five plots. Such examination also shows that the variation in relative standing of the plots where each of the different potash salts was used is fairly constant for each. The most marked exception to this rule is found in the case of plots 30, 36 and 37, where the yields are lower than on other plots receiving the same potash salts. This inferiority on these plots appears to have been due to the fact that the stand of plants in them was too thin. A count indicates that the average number of plants in a row in this field is about 120; in Plot 30 it was about 95; in plots 36 and 37 about 45. The potash salt giving the highest yield in this experiment is the carbonate, followed closely by the highgrade sulfate and silicate. The potash salts, other than kainite, containing chlorine (low-grade sulfate and muriate), give yields considerably lower. As neither the carbonate nor the silicate of potash is commonly found in our markets, these having been manufactured in the first instance as fertilizers for tobacco, the practical lesson to be drawn from the experiment is that for the soy bean it is much safer to depend upon the high-grade sulfate as a source of the needed potash than to use any of the potash salts containing chlorine. Neither the carbonate nor the silicate, even if available, would be preferable to the high-grade sulfate, as the cost per unit of potash is much greater than with sulfate. result of the past season is in agreement with results obtained with this crop in a considerable number of earlier experiments, and it seems impossible to doubt the validity of the conclusion above stated. The advice, therefore, is most strongly given, that, on all soils at least with good retentive qualities and moisture, the sulfate of potash should generally be preferred to muriate or kainite, not only for soy beans, but for clovers and with little doubt for all other legumes as well.

IV. — Special Fertilizer v. Fertilizer Richer in Potash.

This experiment has been in progress since 1891. occupies an acre of ground, divided into four equal plots. The crop from 1891 to 1896, inclusive, was corn: in 1897 and 1898 the crop was mixed grass and clover; in 1899 and 1900 it was corn; in 1901 and 1902, grass and clover; in 1903 and 1904, corn. The land was seeded in the corn in late summer, 1904. The crop harvested this year is hav, mixed timothy, red-top and clover. The object in this experiment is to test the question whether the special corn fertilizers offered in our markets are of such composition as is best suited for the production in rotation of corn and mixed hay. The plots are numbered from 1 to 4. and 3 yearly receive an application of fertilizers furnishing the same amount of nitrogen, phosphoric acid and potash as would be furnished by 1,800 pounds of fertilizer of the composition of the average of the special corn fertilizers analyzed This average has changed but little during at this station. recent years, and in 1899, since which date we have made no change in the kinds and amounts of fertilizers used, was as follows: --

				Per Cent.
Nitrogen, .				2.37
Phosphoric acid,				10.00
Potash,				4.30

The fertilizers used on plots 2 and 4 are substantially the same in amount and kind as recommended in Bulletin No. 58 of this station for corn on soils poor in organic matter. The essential difference in composition between the fertilizer mixtures under comparison is that the mixture used on plots 2 and 4 is richer in potash and much poorer in phosphoric acid than the mixture representing the average market corn fertilizers. The fertilizers applied to the several plots are shown below:—

FER	TIL	IZERS	USEI),		Plots 1 and 3 (Pounds Each).	Plots 2 and 4 (Pounds Each	
Nitrate of soda,						30.0	50.0	
Dried blood, .				٠		30.0	_	
Dry ground fish,		-				37.5	50.0	
Acid phosphate,						273.0	50.0	
Muriate of potash,						37.5	62.5	

The following tables show rates of yields per acre of both hay and rowen on the several plots, and the averages for the two systems of manuring:—

Yields per Acre (Pounds).

I	LOTS	•			Hay.	Rowen
Plot 1 (lesser potash), .					3,960	240
Plot 2 (richer in potash),					3,900	360
Plot 3 (lesser potash), .					3,720	400
Plot 4 (richer in potash),					3,720	300

Average Yields per Acre (Pounds).

PLOTS.	Hay.	Rowen.			
Plot 1 and 3 (lesser potash),				3,840	320
Plots 2 and 4 (richer in potash),				3,810	330

It will be noticed that the yields under the two systems of manuring, both in hay and rowen, are substantially equal. At current prices, the cost per acre of the fertilizers used on plots 2 and 4 is about \$5 less than the cost of the materials used on plots 1 and 3. As we have secured equal crops at a materially lower price, the advantage is clearly with the fertilizer combination richer in potash.

V. — MANURE ALONE v. MANURE AND POTASH.

By way of description of this experiment, I cannot do better than to quote from the seventeenth annual report:—

These experiments, which have for their object to show the relative value as indicated by crop production of an average

application of manure used alone, as compared with a smaller application of manure used in connection with a potash salt, were begun in 1890. The field used is level, and the soil of comparatively even quality. It is divided into four quarteracre plots. The crop grown during the years 1890 to 1896, 1899 and 1900, 1903 and 1904, has been corn. In 1897 and 1898, and again in 1901 and 1902, the crop was mixed grass and clover. Where manure is used alone, it is applied at the rate of 6 cords per acre. Where manure is used with potash, the rates of application are: manure, 4 cords; high-grade sulfate of potash, 160 pounds per acre. Manure alone is applied to plots 1 and 3; the lesser quantity of manure and high-grade sulfate of potash to plots 2 and 4. Estimating the manure alone as costing \$5 per cord, applied to the land, the money difference in the cost of the materials applied is at the rate of \$6.40 per acre, the manure and potash costing that amount less than the larger quantity of manure alone.

Mixed timothy, red-top and clover was sown in late summer in the standing corn of last year. The following tables show the rates of yield on the several plots and the averages under the two systems of manuring:—

Yields	per	Acre,	1905	(Pounds).
--------	-----	-------	------	-----------

PLOTS	Hay.	Rowen.			
Plot 1 (manure alone),				6,720	1,840
Plot 2 (manure and potash),				5,820	1,200
Plot 3 (manure alone),				6,120	1,720
Plot 4 (manure and potash),	à			8,580	1,640

Average Yields per Acre (Pounds).

PLOTS.	Hay.	Rowen		
Plots 1 and 3 (manure alone), .			6,420	1,780
Plots 2 and 4 (manure and potash),			7,200	1,420

It will be noticed that the average yield on the two plots receiving the smaller quantity of manure and potash is somewhat greater than on the other two plots. Since this combination (4 cords of manure and 160 pounds muriate of potash) costs \$6.40 per acre less than the 6 cords of manure, the advantage is decisively in favor of the combination.

VI. - EXPERIMENT IN THE APPLICATION OF MANURE.

This experiment was begun in 1899, and is to be continued for a series of years. It is designed to throw light upon the question as to whether it is economically good policy to spread manure during the late fall and winter and allow it to remain on the surface until spring before plowing under. This method of application is compared with the plan of hauling manure from the stable to the field during the winter and putting it into large compact heaps, from which it is hauled and spread just before plowing in spring. The field in which this experiment is tried slopes moderately to the west. In further description I quote from the seventeenth annual report:—

To insure even quality of the manure used in the two systems, it is our practice to manure two plots at one time, putting the loads of manure as hauled to the field alternately upon the two. in the one case spreading, but in the other putting a sufficient number of loads to provide for the entire plot into one large We are using in this experiment five large plots, each of which is subdivided into two subplots. For one of these subplots the manure is spread when hauled out, for the other it is put into a large heap. The area of these subplots is about one-quarter of an acre, and to each the amount of manure applied is 11,096 pounds. The manure from well-fed milch cows is used upon eight subplots, and horse manure on two. The manure used in this experiment is applied at different dates during the winter, our practice being to allow the manure to accumulate in the pits from which it is taken until there is a sufficient quantity for at least two subplots. The condition of the soil at the time of application and the nature of the weather which follows must necessarily differ in the different experiments; and these differences, together with the difference in the dates of application above referred to, no doubt in a measure account for the variation in the results of the two systems noticed on the different plots.

The crop raised in this field last year was mixed corn and soy beans for ensilage. After the harvest of this crop the field was well harrowed and sown to rve. This crop, which was intended for cover, germinated but poorly and made only a feeble growth. The crop of 1905 was corn, —a number of different varieties received for comparison from the United States Department of Agriculture, and Siblev's Pride of the North of our own growing. These varieties were so arranged that each plot and subplot had equal areas The soil was thoroughly prepared by plowing and harrowing, and the seed was sown on May 19. seasonal conditions were favorable, and the growth was uninfluenced, so far as could be recognized, by accidental conditions. A number of varieties sown showed relatively low productive capacity, and the final yield was lower than is usual in this section on well-manured land of similar quality. The rates of yield per acre and the relative standing of the several plots are shown in the following tables: -

Corn and Stover. - Actual Yields (Rates per Acre).

	ъ-			TH HALF, WI		SOUTH HALF, SPRING APPLICATION.				
	PL	ots.	Stover (Pounds).	Hard Corn (Bushels).	Soft Corn (Bushels).	Stover (Pounds).	Hard Corn (Bushels).	Soft Corn (Bushels).		
1,			7,347	31.51	3.21	7,862	32.16	2.45		
2,			7,150	25.96	2.99	7,763	32.08	4.00		
3,			6,806	22.13	4.36	7,713	27.25	3.53		
1,			7,447	24.44	3.06	8,309	29.20	2.85		
5,			7,637	30.46	2.34	8,026	32.48	2.31		

Corn and Stover. — Relative Yields (Per Cent.).

		Рьот	0			ALF, WINTER ICATION.	SOUTH HALF, SPRING APPLICATION.		
		PLOT	в.		Stover.	Hard Corn.	Stover.	Hard Corn	
1,					100	100	107.0	102.1	
2,					100	100	108.6	123.6	
3,					100	100	113.3	123.1	
4,					100	100	111.6	119.5	
5,					100	100	105.1	106.4	

It will be noticed that in every instance spring manuring has given a larger yield both of stover and of hard corn than winter application. This result is in general agreement with those of earlier years, but the differences as indicated by the relative yields are comparatively small. The winter of 1904 and 1905 was characterized by uniform temperatures, fairly deep and continuous snow cover and absence of thaws. Such conditions are of course favorable to winter application, and the above-mentioned peculiarities of season perhaps account for the smaller relative differences in yield this year.

The system of manuring designated as spring application involves, as will have been noticed by the reader, twice handling, while in winter application the manure is handled but once. Spring application, therefore, costs more than winter application. As the result of our experience, we estimate the money difference to amount to \$4.80 per acre. The average difference in the value of crops this year in favor of spring application, estimating stover to be worth \$5 per ton and the corn as husked 50 cents per bushel, amounts to only \$3.49 per acre, - a sum insufficient to cover the increased cost of spring application. Plot 3, where the difference in favor of spring application is greatest, the money difference in value of the crops on the same basis as before is only \$4.81, which barely covers the increased cost of application. The results for this season, therefore, economically considered, indicate that spreading the manure as taken from the stable in the fall or winter is to be preferred.

VII. — EXPERIMENT IN MANURING GRASS LAND.

The plan of this experiment, which has continued now for thirteen years, will be made clear by quoting from the sixteenth annual report:—

In this experiment, which has continued since 1893, the purpose is to test a system of using manures in rotation for the production of grass. The area used in the experiment is about 9 acres. It is divided into three approximately equal plots. The plan is to apply to each plot one year barnyard manure,

the next year wood ashes, and the third year fine-ground bone and muriate of potash. As we have three plots, the system of manuring has been so arranged that every year we have a plot illustrating the results of each of the applications under trial. The rates at which the several manures are employed are as follows: barnyard manure, 8 tons; wood ashes, 1 ton; ground bone, 600 pounds; and muriate of potash, 200 pounds, per acre. The manure is always applied in the fall; ashes and the bone and potash in early spring.

The past season has been rather unfavorable for the production of large yields of hay, as there was a considerable deficiency in both spring and summer rainfall. The yields of hay and rowen and the total yields for each system of manuring were at the following rates per acre:—

F	RT	LIZE	RS U	SED.			Hay (Pounds).	Rowen (Pounds).	Totals (Pounds).
Barnyard manure,						• .	3,738	1,210	4,948
Bone and potash,							3,326	1,249	4,575
Wood ashes, .							3,816	1,047	4,863

The average yield of the entire area this year was 4,840 pounds per acre. The average yield of the entire area from 1893 to 1904, inclusive, has been 6,718 pounds per acre. The average yield from 1893 to 1905, inclusive, has been 6,479 pounds per acre. The average yields under the different systems of top-dressing have been as follows:—

		Pounds per Acre.
When top-dressed with manure, .		. 6,866
When top-dressed with wood ashes, .		. 6,193
When top-dressed with bone and potash	, .	. 6,524

It will be noticed that the average yields of the entire area for this year are much below similar averages for the period.

VIII. - NITRATE OF SODA FOR ROWEN.

For the past five years we have been experimenting in one of our fields for the purpose of determining whether nitrate of soda applied soon after the first crop is cut will

give a profitable increase in the rowen crop. The field where this experiment has been tried was seeded to pure timothy in the fall of 1897. The growth is now considerably mixed with clover, which has been gradually coming in. whole field is uniformly fertilized for the first crop. materials applied are usually put on in early spring at the following rates per acre: nitrate of soda, 150 pounds; muriate of potash, 200 pounds; fine-ground bone, 400 pounds. This application usually gives us a good crop. of the field is a little more than 3 acres. The rate of yield in the first crop this year was 4,471 pounds of well-cured In this field eight equal plots, containing hav per acre. almost exactly 1/3 acre each, have been laid out. Alternate plots in the series of eight receive annually a top-dressing of nitrate of soda. For the past two years, in order that the nitrate may be more uniformly spread, we have mixed the quantity to be applied to each plot with sufficient basic slag meal to constitute an application at the rate of 400 pounds To equalize conditions on the alternate plots to which no nitrate is applied, the basic slag meal is applied to all of these at the same rate. The rates of application for the fertilizers on the several plots per acre and the yields are shown in the table:—

Nitrate of Soda for Rowen.

	Plots.	FERTILIZERS USED (RATES PER ACRE).	Yield (Pounds).	Increase per Acre (Pounds).
1,		Slag meal, 400 pounds,	975	-
2,		Slag meal, 400 pounds; nitrate of soda, 150	1,127	228
3,		pounds. Slag meal, 400 pounds,	822	-
4,		Slag meal, 400 pounds; nitrate of soda, 150 pounds.	1,036	305
5,		Slag meal, 400 pounds,	640	-
6,		Slag meal, 400 pounds; nitrate of soda, 200 pounds.	1,340	486
7,		Slag meal, 400 pounds,	1,067	-
8,	•	Slag meal, 400 pounds; nitrate of soda, 250 pounds.	3,009	1,942

It will be noticed that the nitrate of soda wherever applied has given an increase in the crop. This increase is relatively small in all the plots except Plot 8, where it is at the rate of

nearly 1 ton per acre. During all the years that this experiment has been tried on this land it has been found that the vield on Plot 8 has been much the largest in the fall. this receives the heaviest application of nitrate, but it is not believed that the superiority in yield is entirely due to this difference. The moisture conditions are more favorable to growth during the late summer in this plot than in the others. During the five years that this experiment in the use of nitrate of soda for the rowen crop has been tried on this field, it has seemed to give increases sufficient to make the application profitable only in two trials; and, on the whole, the results of our experiments are not favorable to the conclusion that it will usually be found profitable to use nitrate of soda for the rowen crop. The soil in this field is a strong and retentive loam. It is, of course, quite possible that on soils of different character the results of the use of nitrate for rowen will be more favorable.

IX. — FERTILIZERS FOR GARDEN CROPS. (FIELD C.)

In this experiment the principal object in view is to study the effect of some of the standard fertilizing materials upon the yield and quality of garden crops. During the earlier years of the experiment, 1891 to 1897 inclusive, fertilizers alone were applied to the land. It was then decided that, since market gardeners as a rule employ large quantities of manure, the value of the experiment to those engaged in that branch of agriculture would be increased by applying manure equally to all the plots, while still continuing the application of fertilizers. During the earlier years of the experiment there were but six plots, on all of which fertilizers were used. With the change in system alluded to a seventh plot was introduced, and to all of the seven plots stable manure at the rate of 30 tons per acre has since been annually applied. It is intended that the seventh plot, on which manure alone is applied, shall serve as a basis of comparison with the others, in order that we may learn whether, and, if so, to what extent, any fertilizers prove beneficial. The seventh plot immediately adjoins the others, but previous to its inclusion in this experiment it had been manured somewhat differently. For the first few years the product on manure alone on this plot exceeded the product with equal manure and fertilizers on the other plots. This initial superiority is gradually disappearing, and the product of most of the crops where the fertilizers as well as manure are used now exceeds that upon the seventh plot, where manure only is used. It is possible that the seventh plot does not even yet serve as a fair basis for comparison; but the following crops on most of the plots, where fertilizers in addition to manure are used, have given yields sufficiently greater than those produced where manure alone is used to much more than pay for the cost of the fertilizers, viz.: asparagus, rhubarb, peas, squashes, tomatoes and table beets. It should be pointed out, however, that such increase was in most cases very small where sulfate of ammonia is one of the fertilizer materials used. Indeed, with asparagus the combination of manure and fertilizers containing sulfate of ammonia gave a smaller yield than manure alone. With tomatoes the increased yield was mainly confined to green fruit. The fertilizers did not materially increase the yield of ripe fruit as compared with the yield obtained on manure alone. Some crops showed no increase at all on the plots where fertilizers were added to the manure. Among these were celery and turnips, while cabbages gave either no increase at all or one which was insignificant.

Practically all important out-door garden crops have been grown in rotation upon each plot, and each crop during several years. The crops so far grown are as follows: spinach, lettuce, onions, garden peas, table beets, early and late cabbages, potatoes, tomatoes, squashes, cucumbers, turnips, sweet corn, celery and strawberries. One row each of asparagus and rhubarb was set in each plot in 1902. The first cuttings were made last year.

As stated in my last annual report, these "experiments have been planned with reference to throwing light especially upon two points: A. The relative value of nitrate of soda, sulfate of ammonia, and dried blood used as sources of nitrogen. B. The relative value of sulfate of potash and muriate of potash. These two points will be separately discussed."

A.— The Relative Value of Nitrate of Soda, Sulfate of Ammonia and Dried Blood as Sources of Nitrogen.

The three fertilizers under consideration have from the first been applied in such amounts as to furnish nitrogen at the rate of 60 pounds per acre to each plot. Each fertilizer is always applied to the same plot. To furnish 60 pounds of nitrogen, the application of the fertilizers at about the following rates per acre is required:—

				2 Ounds
Nitrate of soda, .				375
Sulfate of ammonia,				300
Dried blood				650

Each of these fertilizers is used on two plots, on one of which the source of the potash is the sulfate, on the other the muriate, in both cases in such quantities as to furnish equal actual potash. In addition to the nitrogen and potash fertilizers, dissolved boneblack is applied at the rate of 320 pounds per acre to all plots. The amount of actual potash applied is at the rate of 120 pounds per acre; the amount of actual phosphoric acid at the rate of 50.4 pounds per acre. The source of the potash used affects the results on some of the crops in a marked degree. This is especially the case where sulfate of ammonia is the source of nitrogen.

The results obtained previous to this year may be summarized as follows:—

For the early crops, *i.e.*, the crops making most of their growth before mid-summer, including onions, lettuce, table beets, garden peas, spinach, early cabbages and strawberries, the nitrate of soda has been found the most effective source of nitrogen.¹

The relative standing of the different nitrogen fertilizers, as measured by the total yields, including leaves, vines and tops, as well as the marketable product, is as follows for the early crops:—

				Per Cent.
Nitrate of soda, .				100.00
Dried blood,				95.64
Sulfate of ammonia,				60.95

¹ Sixteenth annual report, Hatch Experiment Station, p. 124.

For the late crops, including late cabbages, celery, tomatoes, turnips and squashes:—

				Per Cent.
Nitrate of soda, .				100.00
Dried blood,				98.88
Sulfate of ammonia,				78.74

The relative average standing of the sulfate and muriate of potash, as indicated by the total yield of all crops grown in Field C previous to this year, is shown in the following table:—

	FEI	RTIL	ZERS	USE	D.			Early Crops (Per Cent.).	Late Crops (Per Cent.)
Sulfate of potash,								100.00	98.32
Muriate of potash,							.	94.04	100.00

For the past year the relative standing of the nitrogen fertilizers for the early crops, including asparagus, rhubarb, strawberries, peas and table beets, is as follows:—

				Per Cent.
Nitrate of soda, .				100.00
Dried blood,				96.11
Sulfate of ammonia,				92.83

For the late crops, including cabbages, celery, tomatoes, turnips and squashes, the relative standing is:—

Nituate of gods				Per Cent.
Nitrate of soda, .				100.00
Dried blood,				97.22
Sulfate of ammonia,				90.51

Combining the results for 1905 with the fourteen previous years, the relative standing of the nitrogen fertilizers is:—

For the early crops:					
					Per Cent.
Nitrate of soda,					100.00
Dried blood,					95.67
Sulfate of ammonia,					63.08
For the late crops:	_				
					Per Cent.
Nitrate of soda, .		•	•		100.00
Dried blood,					98.77
Sulfate of ammonia,					79.52

The relative standing of the potash salts for the present year is:—

For the early cro	ps:-	_					
Sulfate of potash,							Per Cent. 96.52
Muriate of potash,			•		•	•	100.00
For the late crop	s:						
							Per Cent.
Sulfate of potash,							92.08
Muriate of potash,							100.00

Combining the relative standing of the potash salts for 1905 with the figures indicating relative standing for the fourteen previous years, the relative standing is:—

For the early cro	ps:-	-					
Sulfate of potash,							Per Cent. 100.00
Muriate of potash,		•	٠,	•	•	•	94.66
For the late crop	s:—						
							Per Cent.
Sulfate of potash,	•				•		97.90
Muriate of potash,							100.00

The results of the experiments for this year will not be reported in detail. The following points are worthy of mention:—

- 1. Nitrate of soda appears to be the best source of nitrogen for asparagus, table beets, cabbages and squashes.
- 2. Dried blood as the source of nitrogen has given the largest crops in the case of strawberries, peas, tomatoes and celery.
- 3. Sulfate of potash as the source of potash seems to be superior for asparagus, peas, beets and cabbages.
- 4. Muriate of potash gives results superior to those obtained with the sulfate for rhubarb, strawberries, squashes, tomatoes and celery.
- 5. Sulfate of ammonia for practically all crops appears to have been the poorest material used as a source of nitrogen.

X. — Alfalfa.

Our experiments with alfalfa have been continued both upon our own grounds and those of a few selected farms in different parts of the State. We are bringing to bear upon these experiments information in regard to successful methods from every possible source. We find in all cases a distinct benefit from a heavy initial application of lime. We have used from 2,000 to 3,000 pounds per acre. We are enriching soils already naturally good by heavy applications both of manures and fertilizers, using materials which experience has proved best. We are also giving the soil a most thorough preparatory tillage. It has usually been fall-plowed, and in addition it is plowed in the spring, and repeatedly harrowed to destroy weeds which start in the early part of the season. We have tried inoculating the soil both with earth obtained from a field in New York, where alfalfa is successfully grown, and with the cultures sent out by the Department of Agriculture and prepared by private firms. We have not attained such degree of success as justifies us in recommending the crop. We have occasionally got a fair stand of alfalfa, but in all cases the winters prove more or less injurious. In the course of a few years the alfalfa is mostly crowded out by grasses and The alfalfa almost every year suffers from leaf spot, which tends to cut down the yield.

We have found a very distinct benefit from the inoculation with earth from the New York alfalfa field. We have not found an equally distinct benefit to follow inoculation with any of the cultures; and, although we are not as yet ready to make a final report, it should be here remarked that the most careful experiments on the use of these cultures in sterilized soils, under conditions calculated to give accurate results, indicate that they have little if any value.

In our various experiments alfalfa has been tried on a wide variety of soils. We have had a quarter of an acre field upon a coarse-textured soil upon a farm in this neighborhood where there is never any standing water within 50 to 60 feet of the surface. Even on this soil the alfalfa,

although it did fairly well for a year, has been injured by successive winters, until it is at the present time almost ruined.

In this connection I call attention further to the fact that Mr. D. S. Bliss of the Department of Agriculture, who has been making special efforts to promote the introduction of alfalfa into New England, and who has travelled extensively for the purpose of studying the results obtained, now speaks very discouragingly as to the outlook in general.

In conclusion, while we are not inclined to discourage experiments with alfalfa, we do wish most emphatically to caution against engaging in these experiments upon an extended scale, for we feel that disappointment is almost inevitable.

XI. — POULTRY EXPERIMENTS.

Our work with poultry during the past year has had the same general purpose in view as in former years, namely, to throw light on the question of the proper selection of feeds for laying fowls. The fowls used in the experiments were pullets of our own raising, and matched flocks have been kept, as in former years, each in a house by itself, all the houses being of precisely similar dimensions and construction.

1. The two flocks in houses Nos. 1 and 2 have been fed on rations characterized by high content both of ash and fat The deficiency of wheat in fat as compared and low fiber. with corn is made up in the ration fed to the fowls in House No. 1 by the use of corn oil, the total amount of fat in the foods used being substantially the same for the two rations. This experiment, therefore, in a general way affords opportunity to test the relative value for egg production of wheat The ration fed the fowls in House No. 1 contains a relatively high percentage of protein, and has a narrow nutritive ratio. The ration used in House No. 2 contains a relatively low percentage of protein, and has a wide nutritive ratio. The animal food used in both these rations was The following results were obtained: for the beef scraps. first period, March 2 to May 12, inclusive, the wheat ration produced eggs at the average rate of .39 per hen day, the

corn ration at the rate of .45 per hen day; in other words, 100 hens would have laid 39 eggs per day on the wheat ration and 45 eggs per day on the corn ration. For the second period, May 13 to September 23, inclusive, the wheat ration produced an average of .31 eggs per hen day, the corn ration at the rate of .41 eggs per hen day; in other words, during the summer period 100 hens would have laid 31 eggs per day on the wheat ration and 41 eggs per day on the corn ration. The average food cost per egg produced was: for the wheat ration 1.036 cents, for the corn ration .749 cents, for the first period; while for the second period the cost per egg on the wheat ration was .895 cents and for the corn ration .703. The gross cost of the food on the wheat ration varied from about .26 cents to .37 cents per day for each fowl; while on the corn ration the cost varied from .27 cents to .30 cents per day. The number of eggs on the corn ration was considerably greater than on the other, and the cost per egg was much smaller. This result is in agreement with the results of most of the similar experiments which we have tried in earlier years. We are certainly justified in the conclusion that corn has superior merits for egg production as compared with wheat.

2. The rations fed to the fowls in pens Nos. 3 and 4 were characterized by relatively high ash and low fiber content. Milk albumen was used as the source of animal food on account of the low percentage of fat it contains; and the rations fed to the fowls in both of these pens were characterized by much lower fat content than the rations fed to the fowls in pens Nos. 1 and 2. As in the first set of comparisons, the fat content of the two rations used in pens Nos. 3 and 4 was equalized by the addition of corn oil to the one naturally lower in fat. In this experiment, as in the first, wheat was the leading whole grain in the ration fed to the fowls in one house (No. 3); corn the leading whole grain used in the other house (No. 4). The results with the fowls in these houses, like the results obtained in houses Nos. 1 and 2, afford a basis for estimating the relative value of wheat and corn, but with a relatively low percentage of fat in both. The egg product in this experiment was as follows: for the first period, March 3 to May 12, inclusive, the wheat ration produced eggs at the average rate of .41 per hen day, the corn ration .39 per hen day; or, in other words, 100 hens would have laid on the wheat ration 41 eggs, on the corn ration 39 eggs, per day. For the second period, May 13 to September 23, inclusive, the wheat ration gave an average of .35 eggs per hen day, the corn ration .31; or, in other words, respectively for the wheat ration, an average of 35 eggs per hundred hens daily, and for the corn an average of 31 eggs. The food cost of the eggs in this experiment was as follows: for the wheat ration during the summer period, .845 cents per egg; for the spring period, 1 cent per egg. For the corn ration, the food cost per egg was .871 cents for the summer period; .942 cents for the spring period. The cost of food per hen daily on the wheat ration varied from .273 to .372 cents; for the corn ration, from .248 to .333 cents. In this experiment the wheat ration gave a somewhat better egg yield than corn, but at a higher average cost per egg. The experiment indicates, therefore, that, unless the fat content of the ration is relatively high, the more starchy foods are not sufficient to produce a satisfactory egg vield, and the product falls below that obtained from feeding a ration higher in protein.

3. The fowls in houses Nos. 5 and 6 were fed rations in both cases characterized by low protein, high ash and high fat content, the deficiency of fat in the grains selected being made up by the use of corn oil. The fowls in Pen No. 5 were fed grains, including oats and oat feed, characterized by a high proportion of fiber. Those in Pen No. 6 were fed grains among which rice was prominent, characterized by a low percentage of fiber. The experiment in these houses, then, was calculated to throw light upon the influence of fiber on egg production, the nutritive ratio in the two houses being substantially the same, — about 1 to 6.5. In these houses beef scraps was the animal food used. results were as follows: For the period March 2 to May 12, inclusive, the egg production was: for the oat ration (high fiber) .40 eggs per hen day, for the rice ration (low fiber) .42 eggs per hen day; or, in other words, from 100 hens

daily respectively 40 and 42 eggs. For the second period, May 13 to September 23, inclusive, the averages were: on the oat ration .38 eggs per hen day, on the rice ration .46 eggs per hen day; or, from 100 hens daily respectively 38 and 46 eggs. The food cost of the eggs has been as follows: for the oat ration during the first period 1.019 cents, for the second period .935 cents; for the rice ration for the first period 1.103 cents, for the second period 1.048 cents. The cost of food per hen per day has varied for the oat ration from .32 to .40 cents; for the rice ration from .412 cents to .423 cents per day. The rice ration, as last year, has given a very satisfactory yield of eggs, but, as was then stated, its high price at the present time renders it poor economy to use it. We are employing it in these experiments because it contains less fiber than any other grain, and we are trying to throw light upon the influence of fiber in egg production. The indication this year, as last, is very clear that this influence is unfavorable.

The nutritive ratios in the food combinations used in the different experiments of the past year have been as follows: for the rations where wheat is compared with corn with beef scraps for animal food and high fat content, — for the wheat ration, between 1 to 4.57 and 4.26; for the corn ration, between 1 to 6.69 and 5.81; for the experiment in which wheat is compared with corn with milk albumen and beef scraps for animal food, — for the wheat ration, between 1 to 4.03 and 4.54; for the corn ration, 1 to 5.63 and 5.84; in the experiment in which oats and rice have been compared with high fat content, — for the oats, between 1 to 5.88 and 6.49; for the rice, between 1 to 5.84 and 6.53.

Our experiments clearly do not support the view that a narrow nutritive ratio is essential to good egg production.

REPORT OF THE HORTICULTURIST.

F. A. WAUGH.

The work of the division of horticulture for the past year has followed the lines announced in previous reports. It has been concerned chiefly with the propagation of plants, more especially dwarf fruit trees, with problems in pruning, and with the systematic study of varieties. During the year some interesting experiments in the growing of mushrooms have been under way. There follows herewith a report of progress in the experiments in pruning peach trees of bearing age.

PRUNING PEACH TREES.

A year ago this department made a report on experiments in pruning peach trees.¹ Another year has thrown new evidence on the problems involved, so it seems best to take up the subject again. In the mean time the trees have borne a considerable crop of fruit, and their behavior under this load has been particularly interesting.

Last year's report dealt with various problems, one of which was the practice of pruning frozen peach trees to help their recovery. Briefly stated, the experiment comprised four methods of treatment, as follows: (a) no pruning; (b) moderate pruning; (c) severe heading back; (d) cutting back to stubs, or "dehorning." The results of these various methods of pruning, as developed up to the time of making last year's report (December, 1904), showed that moderate pruning was to be preferred. It may be said at once that this general conclusion stands without much modification, though the severely pruned trees made a relatively better showing under the stress of a good crop of fruit.

¹ Hatch Experiment Station, seventeenth annual report, p. 162 (1905).

Perhaps the fact most obviously developed by the year's experience is that the trees were more severely injured by the freezes of 1902–03 and 1903–04 than had been supposed. From week to week one tree after another broke down or split down or lost large branches, through the stress of winds or growing fruit crop. As each successive tree broke down, it was plainly to be seen that the wood had been seriously injured by freezing, and that it had not recovered. Though the tree kept on growing, adding fresh and healthy outer layers of wood, the interior was dead and decaying. In many cases this decay was serious, and had extended through considerable areas of tissue. Many fungi (mostly saprophytes such as feed on dead wood) had gained a foothold, and seemed to be out-thriving the peach trees.

These evidences of decay, especially the larger fungi (polypori, etc.), were most conspicuous on the "dehorned" trees. A few of these trees have finally succumbed during the summer of 1905, and it is now plainer than it was a year ago that this method of treating severely frozen peach trees is not to be recommended. An additional drawback lay in the fact that the trees bore little or no fruit in 1905, while all the other trees in the experiment bore a good crop.

Perhaps a word of explanation should be added to this statement of the case. This method of pruning peach trees back to mere stubs has its uses, as in renewing the head when a tree is to be rebudded to a new variety. It can be successfully carried out, but only on vigorous and comparatively young trees. Trees weakened by freezing are precisely the ones which cannot respond to such vigorous treatment.

Coming next to the trees severely headed back (from which practically all the one-year-old wood was removed in the spring of 1905), we find conditions much better. There are some manifest evidences of the injury received during the freezes of two and three winters ago, some broken limbs and some growth of saprophytic fungi; but the trees show strong, sturdy tops, with a very satisfactory annual growth for 1905. The trees bore a good crop of fruit in 1905, and are in the best condition of any in the orchard for carrying

another crop in 1906. While trees severely headed back recovered less readily from the effects of freezing, those which finally bore the crop made distinctly better growth for the pruning.

The trees lightly pruned were cut back only a part of the previous year's annual growth, — from one-third to one-half. The largest percentage of recovery was shown by these trees, and they bore slightly larger crops of fruit in 1905 than any of the others. On the other hand, there appeared to be more breakage of large branches, the heads are left in less satisfactory form than on trees severely headed back, and the prospect for carrying a good crop in 1906 seems to be slightly less.

The trees left without pruning are now distinctly the poorest in the orchard, with the exception only of those that were "dehorned." The percentage of loss was high, the crop of 1905 was inferior to that on the pruned trees, and the present condition of these trees is unsatisfactory.

As the result of this experiment, the following practice would seem to be indicated:—

- 1. Prune peach trees moderately, removing not more than one-third to one-half the previous year's annual growth, when the wood has been injured by freezing.
- 2. When only the fruit buds are killed, the wood being uninjured and the trees in good condition, prune severely, cutting back the annual growth to two or three buds. It may be expedient to cut some branches back even into two or three year old wood.

REPORT OF THE CHEMIST.

DIVISION OF FERTILIZERS AND FERTILIZER MATERIALS.¹

CHARLES A. GOESSMANN.

Assistants: HENRI D. HASKINS, EDWARD G. PROULX, E. T. LADD.

Part I.—Report on Official Inspection of Commercial Fertilizers.

PART II. — Report on General Work in the Chemical Laboratory.

Part I.—Report on Official Inspection of Commercial Fertilizers and Agricultural Chemicals during the Season of 1905.

CHARLES A. GOESSMANN.

The total number of manufacturers, importers and dealers in commercial fertilizers and agricultural chemicals who have secured licenses during the past season is 64; of these, 36 have offices for the general distribution of their goods in Massachusetts, 9 in New York, 6 in Connecticut, 3 in Vermont, 2 in Ohio, 1 in Rhode Island, 1 in Maryland, 1 in Tennessee, 1 in Arkansas, 1 in Missouri, 1 in Canada, 1 in New Jersey and 1 in Pennsylvania.

¹ See also tables in Appendix.

Three hundred and twenty-six brands of fertilizers and agricultural chemicals have been licensed in Massachusetts during the year. Five hundred and seventy-four samples of fertilizers have been collected up to the present time, in our general markets, by experienced assistants in the station. Five hundred and eleven samples had been analyzed at the beginning of December, 1905, representing 313 distinct brands of fertilizers. These analyses were published in two bulletins of the Hatch Experiment Station of the Massachusetts Agricultural College: No. 104, July; No. 107, November, 1905. The analyses of other officially collected samples of fertilizers not included in these two bulletins will be published in our next bulletin, in March, 1906. same number of fertilizers were licensed in Massachusetts during the year as in 1904. The results of our inspection work show 18 more samples analyzed during the season than for the previous year.

The following table gives a brief abstract of the results of analyses of the official commercial fertilizers in comparison with the year previous:—

	1904.	1905.
(a) Where three essential elements of plant food were guaranteed:—		
Number with three elements equal to or above the highest guarantee, .	7	3
Number with two elements above the highest guarantee,	32	16
Number with one element above the highest guarantee,	111	83
Number with three elements between the lowest and highest guarantee,	190	203
Number with two elements between the lowest and highest guarantee,	146	138
Number with one element between the lowest and highest guarantee, .	48	38
Number with three elements below the lowest guarantee,	none	1
Number with two elements below the lowest guarantee,	12	25
Number with one element below the lowest guarantee,	103	92
(b) Where two essential elements of plant food were guaranteed:—		
Number with two elements above the highest guarantee,	8	3
Number with one element above the highest guarantee,	16	29
Number with two elements between the lowest and highest guarantee,	20	13
Number with one element between the lowest and highest guarantee, .	19	23
Number with two elements below the lowest guarantee,	1	5
Number with one element below the lowest guarantee,	15	21
(c) Where one essential element of plant food was guaranteed:—		
Number above the highest guarantee,	16	4
Number between the lowest and highest guarantee,	24	25
Number below the lowest guarantee,	18	19

From the above table it will be seen that the quality of the licensed fertilizers during the past year has not been up to the usual standard.

Trade Values of Fertilizing Ingredients in Raw Materials and Chemicals, 1904 and 1905 (Cents per Pound).

										1904.	1905
Nitrogen in ammonia salts, .										17.50	17.50
Nitrogen in nitrates										16.00	17.00
Nitrogen in nitrates, Organic nitrogen in dry and fine-g	rom	id fi	sh. r	neat.	blo	od, a	nd i	n hio	h-		
grade mixed fertilizers, .										17.50	18.50
Organic nitrogen in fine bone and	tank	age								17.00	18.00
Organic nitrogen in coarse bone ar	nd ta	nk	ie.							12.50	13.00
Phosphoric acid soluble in water,										4.50	4.50
Phosphoric acid soluble in ammon	ium	cit	rate.							4.00	4.00
Phosphoric acid in fine-ground fish										4.00	4.00
Phosphoric acid in cotton-seed me	al. c	asto	or no	mac	e an	d we	boc	ashes		4.00	4.00
Phosphoric acid in coarse fish, bor	ne a	nd t	anke	ge.					,	3.00	3.00

in mixed fertilizers.									΄.	2.00	2.00
Potash as sulfate, free from chlori	des.				i					5.00	5.00
Potash as muriate (chloride), .				:						4.25	4.25
Potash as carbonate										_	8.00

A comparison of the market cost of the three essential elements of plant food for 1905 with the previous year shows the only variation to be in the various forms of nitrogen compounds: nitrogen in the form of nitrates, and the higher grades of organic nitrogen, including nitrogen in high-grade mixed fertilizers, is a cent higher per pound; while the medium and lower grades of organic nitrogen also show an increased cost of one-half cent per pound. All nitrogen compounds, with the exception of ammoniates, show somewhat of an increase in cost as compared with 1904.

The above schedule of trade values was adopted by representatives of the Massachusetts, Connecticut, Rhode Island, Maine, Vermont and New Jersey experiment stations at a conference held during the month of March, 1905, and is based upon quotations in the fertilizer market in centers of distribution in New England, New York and New Jersey during the six months preceding March, 1905, and refers to the current market prices, in ton lots, of the leading standard raw materials furnishing nitrogen, phosphoric acid and potassium oxide, and which go to make up our commercial fertilizers.

Table A, on the following page, gives the average composition of licensed fertilizers for 1905; Table B gives a compilation of analyses showing the average percentages, as well as the maximum and minimum percentages, of the three essential elements of plant food found in the so-called special crop fertilizers put out by the different manufac-This latter table shows how unsafe it is to be guided wholly by trade name when selecting a fertilizer for any Out of the several hundred fertilizers that are special crop. annually offered for sale in the general markets in Massachusetts, it becomes no easy matter for the farmer to select to meet his requirements in cases of the ready factory-mixed goods. No infallible rule can be laid down, as soil conditions vary so widely, and so much depends upon crop rota-It is safe to say, however, that the higher-grade fertilizers are the most economical ones to buy. tilizers should be purchased which furnish the most nitrogen, potash and phosphoric acid in a suitable and available form for the same money.

PART II. — REPORT ON GENERAL WORK IN THE CHEMICAL LABORATORY.

C. A. GOESSMANN.

- 1. Analyses of materials forwarded for examination.
- 2. Notes on wood ashes and lime ashes.

1. Analyses of Materials forwarded for Examination.

We have received 257 samples of miscellaneous substances, during the season, from farmers within our State. As far as circumstances and time permit we have taken up these materials for analysis, and as a general thing have reported results in the order of their arrival at this office. As in the past, we have been obliged to neglect this class of work until a lull occurred in the official inspection of commercial fertilizers. From December to April we have most time to devote to the investigation of general material, and for this reason would prefer to have the samples forwarded whenever possible, so they may be taken up during these months. This would insure more prompt reports of the results of analyses.

We have taken the usual active part in the technical chemical work of the Association of Official Agricultural Chemists for the establishment of new methods of chemical analysis, more particularly in regard to fertilizer work and the analysis of insecticides. We have also been in cooperation with the American Chemical Society and the United States Geological Survey in regard to technical details in the chemical analysis of argillaceous limestone. The results of these analyses were sent to the respective parties in Washington.

Following is a list of materials forwarded by farmers during the year: —

			*		
Soils,		54	Factory waste,		2
Wood ashes,		47	Ashes from leather scraps,		2
Complete fertilizers, .		32	Insecticides,		2
Cotton-seed meal, .		24	Oyster shells,		1
Lime ashes,		8	Sulfate of ammonia, .		1
Miscellaneous materials,		7	Blood,		1
Nitrate of soda,		6	Wool waste ashes, .		1
Manure,		6	Chicken grit,		1
Muek,		5	Tobacco dust,		1
Tankage,		4	Argillaceous limestone,		1
Superphosphate,		4	Burned bone,		1
Cotton-hull ashes, .		4	Low-grade sulfate of potas	h,	1
High-grade sulfate of pot	ash,	3	River mud,		1
Ground bone,		3	Cob ashes,		1
Bone and meat,		3	Castor pomace,		1
Sheep manure,		3	Linseed meal,		1
Peruvian guano,		3	Mud from seaweed, .		1
Peat,		3	Cotton-seed compost, .		1
Dry ground fish,		2	Damaged cocoa,		1
Dissolved bone-black, .		2	Prepared bone,		1
Wood charcoal,		2	Vegetable potash, .		1
Muriate of potash, .		2	Rotten cotton waste, .		1
Carbonate of potash, .		2			

2. Notes on Wood Ashes and Lime Ashes.

(a) Wood Ashes.

Eighteen and one-half per cent. of the materials forwarded by farmers during the year have been wood ashes. The following table shows their chemical composition as compared with the previous year:—

Analysis of Wood Ashes.

					NUMBER OF	F SAMPLES
					1904.	1905.
Moisture from 1 to 10 per cent., .					18	15
Moisture from 10 to 20 per cent., .					16	20
Moisture from 20 to 30 per cent., .					8	7
Moisture above 30 per cent.,					3	1
Potassium oxide above 8 per cent., .					2	4
Potassium oxide from 6 to 7 per cent.,				.	8	4
Potassium oxide from 5 to 6 per cent.,	٠.			.]	6	12
Potassium oxide from 4 to 5 per cent.,					12	13
Potassium oxide from 3 to 4 per cent.,					10	7
Potassium oxide below 3 per cent., .					7	3
Phosphoric acid above 2 per cent., .					3	7
Phosphoric acid from 1 to 2 per cent.,					30	32
Phosphoric acid below 1 per cent., .					12	4
Average per cent. of calcium oxide (li	ime),				30.16	32.30
Insoluble matter below 10 per cent.,					6	9
Insoluble matter from 10 to 15 per cent	j.,				18	14
Insoluble matter above 15 per cent,					. 20	20

Table showing the Maximum, Minimum and Average Per Cents. of the Different Ingredients found in Wood Ashes, 1904 and 1905.

		Max	IMUM.	Mini	MUM.	AVERAGE.	
		1904.	1905.	1904.	1905.	1904.	1905.
Moisture at 100° C.,		37.85	32.05	none.	.02	14.42	13.45
Potassium oxide,		11.04	8.68	.80	2.32	4.51	5.09
Phosphoric acid,		6.07	4.74	.28	.38	1.37	1.67
Calcium oxide, .	.	42.86	49.24	19.73	21.17	30.16	32.30
Insoluble matter,		47.21	33.32	4.56	4.15	18.35	15.49

From the above comparison it will be seen that the ashes analyzed during the year are of much better quality than for the year 1904. We wish to urge parties who buy wood ashes to patronize those importers and dealers who have secured a license for the sale of ashes in Massachusetts, for

it is only in this way that they can secure protection by our State laws. Wood ashes should always be bought on a statement of guarantee of potash, phosphoric acid and lime.

(b) Lime Ashes.

Table showing the Maximum, Minimum and Average Per Cents. of the Different Ingredients found in Lime Ashes, 1904 and 1905.

		MAXI	MUM.	MINI	MUM.	Average.	
		1904.	1905.	1904.	1905.	1904.	1905.
Moisture,		36.62	19.35	none.	.05	10.88	11.18
Potassium oxide,		2.46	4.80	.06	1.02	1.54	2.47
Phosphoric acid,		1.48	1.58	trace.	.18	.74	.97
Calcium oxide, .		55.24	63.44	21.92	37.56	42.93	49.34
Insoluble matter,		25.47	28.93	2.76	3.21	8.11	8.99

It will be seen from the above comparison that the average composition of lime ashes for the past year is superior to that of 1904. The only safe way to buy lime ashes is to insist upon a guarantee of potash, phosphoric acid and lime which they are said to contain.

REPORT OF THE CHEMIST.

DIVISION OF FOODS AND FEEDING.1

J. B. LINDSEY.

Chemical Assistants: E. B. HOLLAND, P. H. SMITH, E. S. FULTON,² A. C. WHITTIER.

Inspector of Feeds and Babcock Machines: A. Parsons, F. G. Helyar.

Dairy Tester: S. R. PARKER.

In Charge of Feeding Experiments: J. G. COOK, 4 R. F. GASKILL.

Stenographer: MABEL C. SMITH.

⁴ Resigned Aug. 1, 1905.

PART I. — THE WORK OF THE YEAR.

J. B. LINDSEY.

1. Correspondence.

The answering of inquiries relative to feeding and dairy problems has continued to be a feature of the correspondence of this department. Grain dealers appear desirous of being well posted on the various feed stuffs in the market, and are constantly writing for information. The total number of letters of all kinds sent out during the year was approximately 3,600.

2. Summary of Laboratory Work.

The usual variety of chemical work has been carried out during the year.

There have been sent in for examination 102 samples of water, 792 of milk, 1,717 of cream, 5 of butter, 191 of feed stuffs and 6 miscellaneous. In connection with experiments by this and other divisions of the station, there have been analyzed, in whole or in part, 236 samples of milk and cream and 142 of fodders and feed stuffs. This makes a total of 4,042 substances analyzed during the year, as against 4,261 last year and 3,897 in the previous year. Work on the determination of sulphur in organic bodies, and nitrogen compounds in cheese, not included in the above, has been done for the Association of Official Agricultural Chemists. In addition, 13 candidates have been examined and given certificates to operate Babcock machines, and 1,665 pieces of glassware have been tested for accuracy, of which 197 pieces, or 11.83 per cent., were condemned.

3. Water Analysis.

The experiment station has made a feature of sanitary water analysis since its establishment in 1882. Within a few years a charge of \$3 a sample has been placed upon this

work, in order to hold in check many who have seemingly abused the privilege of free analysis. Instructions for securing an analysis are issued in circular form, as follows:—

Those wishing to secure a sanitary analysis of water must first make application, whereupon a glass bottle securely encased, accompanied by full instructions for collecting and shipping the sample, will be forwarded by express. The return express must in all cases be prepaid. Because of the smallness of the sum involved, no account will be opened. Remittance by check, P. O. money order, or money at the owner's risk, must be strictly in advance.

Address

Dr. J. B. LINDSEY,

Hatch Experiment Station, Amherst, Mass.

The results of the analysis are forwarded on especially prepared blanks, with such additional remarks concerning the condition of the water, and its possible improvement, as is warranted in each case. This station does not make mineral analysis of water, excepting at rare intervals by special arrangement.

4. Dairy Products and Cattle Feeds.

This department makes free analyses of milk, cream and cattle feeds for farmers and others, in so far as its resources permit. About the usual number have been received during the year. Many farmers and dairymen desire to know the percentage of fat and total solids in the milk produced by their herd and by individual animals, and send samples to the station for analysis. They are thus enabled to determine the quality of the product placed upon the market, and also the value of the cow for profitable milk production. quality of the milk shipped to Boston is carefully scrutinized by the several contractors, and producers frequently send samples to the station, to ascertain whether their product is conforming to the legal requirements. Parties who have been warned by the contractors, or have had their milk refused, likewise forward samples, with requests for information as to methods of betterment. The station tries to be as helpful as possible in all such cases. One creamery sends

its samples regularly, and others send occasional lots, when not in condition to satisfactorily perform the work, or when desiring to check their own results. A charge is made in such cases sufficient to cover the cost of the work.

Farmers and grain dealers are constantly sending samples of feeds for examination, to determine their value and whether they are as represented. This work takes considerable time, but it is worthy of encouragement. It must not be understood, however, that the station furnishes a free chemical laboratory for jobbers and manufacturers who wish to ascertain the composition of their feeds for commercial purposes. The station does not solicit work of this character, but is willing to undertake a limited amount for a reasonable compensation.

5. Special Chemical Work.

During the year the department has undertaken co-operative work on chemical methods in connection with the Association of Official Agricultural Chemists, and has studied particularly methods for the determination of sulphur in organic substances, and of nitrogenous compounds in cheese. The department has also co-operated with the department of botany in ascertaining the amount of starch and sugars in cucumber leaves, grown under definite conditions.

6. FEED CONTROL (ACTS OF 1903, CHAPTER 202).

The several provisions of this act have been executed as heretofore. Bulletin No. 101, containing the analyses of 306 samples of feeds collected the previous autumn, was distributed early in January of 1905. This bulletin also contained many remarks and suggestions on the nutritive and commercial values of concentrates. Bulletin No. 106, sent out in October, 1905, gave the chemical and microscopic analyses of 65 samples of condimental stock and poultry foods, and the results of an experiment with Pratt's food. During the months of January, February, March and April, the inspector twice visited the most important cities and towns in the State, and collected 481 samples of feeds. The entire collection was tested during the late spring and early

summer. For financial reasons, it was not possible to publish the results in bulletin form. Those that were considered at all suspicious were examined by both the chemist and the microscopist, and the attention of retail dealers, jobbers and manufacturers called to any irregularities. Brief notes regarding this collection were published in Bulletin No. 106. The inspector canvassed the entire State in September and October, and the 365 samples collected are now being examined, and the results will be ready for publication in December.

The large majority of manufacturers, jobbers and retailers willingly conform to the requirements of the law. Considerable difficulty is frequently experienced in obtaining a statement in full, many omitting the weight of the package, and a few stating the protein and fat guarantees together. Some manufacturers and jobbers have been lax in attaching any guarantee whatever, and retailers have frequently offered unguaranteed goods for sale. The station has endeavored to be very patient with offenders, giving them full opportunity to conform to the statute requirements. The writer recognizes the diversity of conditions governing the purchase and sale of the great variety of concentrated feeds, and has been willing to condone many technical violations of the law, when it appeared that no intentional offence was intended. Some parties seem inclined to take advantage of this seeming leniency, and such it may be necessary to call to a sharp account.

The value of an intelligent and tactful inspector cannot be too strongly emphasized. He is in position to impart much valuable information to the dealer, and to smooth out many difficulties that may arise. The station finds it difficult to retain the services of a satisfactory person for any length of time, because of the small salary paid.

The great bulk of feed now offered is free from intentional adulteration, and is as represented. Buyers, as a rule, have only themselves to blame if they are defrauded. Much cotton-seed meal is being guaranteed several per cent. lower in protein than formerly, manufacturers claiming that it does not pay them to completely remove the hulls. It is

also stated that this lower-grade meal is shipped from other territory than that formerly supplying the Massachusetts markets.

Gluten feed and wheat by-products tested low in protein during 1905, owing to the inferior character of the 1904 corn and wheat.

Porto Rico molasses and a considerable variety of molasses feeds are being freely offered. The station is making a special study of these products, and hopes to publish the results in bulletin form within the next few months.

Rice by-products in considerable quantity are being sold in the southwest, but as yet they have not been offered in local markets. Detailed information concerning the composition and value of concentrates may be obtained by consulting the special bulletins on the subject.

7. An Act for the Protection of Dairymen (Acts of 1901, Chapter 202).

This act makes it obligatory for all creameries and milk depots within the State, employing the Babcock test or any other test for determining the value of milk or cream, to have all graduated glassware used in making such determinations tested for accuracy by this station. It further requires that all parties intending to operate such machines must first be examined for competency by the proper official of the station. Once each year the station is obliged to send a competent party to each creamery and milk depot within the State where such machines are in use, to duly inspect said machines and pronounce upon their fitness for the work. This department has endeavored to carry out the several provisions of this law with the same care as formerly. The following is a brief report of the work for 1905:—

Inspection of Glassware. — All glassware found to be correctly graduated has been marked "Mass Ex St." There were 1,665 pieces examined, of which 197, or 11.83 per cent., were condemned. The inaccurate bottles were largely of the bulb type (Bartlett). Until last year these bottles have been passed on accuracy of total graduation, as the usual charge of 5 cents a piece would not permit of additional

testing. Because of the difficulty in securing a correct graduation, it has been necessary to test the three distinct portions of the scale at a corresponding increase in cost. The use of this type of bottle is not to be encouraged.

Examination of Candidates. — A few less candidates than usual were examined, and 13 certificates of competency issued. Many candidates showed poor manipulation, and lacked a thorough understanding of the method. In case of failure, applicants are obliged to wait a month before a second examination will be given.

Inspection of Babcock Machines. — The inspection of machines the present year has been in charge of Mr. Frank G. Helyar, who makes the following report:—

The annual inspection of Babcock machines was made in November and December. Fifty-two places were either visited or heard from, of which number only 36 were amenable to the inspection. Those creameries or milk depots that did not come under the inspection were exempt for two reasons: some of them do not possess a machine, but have their samples regularly tested by city inspectors; while others have machines, but from all that can be learned they neither buy nor sell milk or cream on the results of their own tests. In suspicious cases they carry samples to the city inspector. There are three creameries paying by the space and one by the churn test.

Of the total number, 34 were creameries and 18 were milk depots. Of the 34 creameries, 19 were situated west of the Connecticut River, and, as a rule, in the back-hill towns, away from good transportation facilities. The rest of the creameries were scattered throughout the eastern part of the State. The milk depots, on the other hand, are situated nearer the large cities. Twenty of the milk depots and creameries were cooperative, while the rest were either proprietary or stock companies. The number of co-operative creameries is steadily decreasing.

As a whole, the machines were found to be in very good condition, none being condemned, and only 3 needing repairs. The cast-iron machine is being used in every place visited but 4. The Facile is used in 19 places, the Agos in 9 and the Wizard in 3.

Most of the owners of the Babcock machines have recognized

the value of a substantial foundation as a factor in keeping their machines in good repair. Still, there are a few machines that are being used on rather insecure and shaky supports. As a result, these machines are always a little out of level, and run with more or less unnecessary vibration. Some machines, even with repairs suggested in previous inspections, still overheat the samples. The operators of these machines counteract this by allowing the machine to run a few moments at the end of the test with the cover lifted. No machine was found that insufficiently heated the samples. The steam gauges, with only one or two exceptions, were found to be in good order. In those cases where they were not in good order, speed indicators are used to check up the speed of the machines.

Only in one place was untested glassware found. In some cases it was not as clean as it ought to be, but, on the whole, may be said to be in very good condition.

In addition to the regular work of the inspection, 4 city milk inspectors were visited. Only 1 desired an examination. His machine, an electrical Wizard, was given a certificate.

The above law is not as comprehensive as one could wish. It makes no financial provision for the purpose of carrying out the provisions of section 3 (inspection of machines), but requires the director of the station, or his agent, to make the inspection, and to assess the cost upon the several creameries inspected. The station is obliged to advance the expense out of its treasury, and collect 35 or 40 small bills resulting. Most creameries pay with a reasonable degree of promptness, but a few parties are obstinate and slow.

After the station has issued a certificate of competency to the operator of a Babcock machine, it has no further control over said party, even though he may prove careless, and even dishonest in his future operations. The law could be improved, and thus give a fuller measure of protection to dairymen, by a small annual State appropriation, together with the necessary authority to make a semi-annual inspection of all Babcock or similar machines, and of all glassware used in connection therewith, and by empowering the director of the experiment station, or some other competent party, to rescind the license of all operators who do not appear to be satisfactorily performing their duties.

8. The Testing of Pure-bred Cows.

Breeders of pure-bred Jersey, Guernsey and Holstein cattle are making tests of the weekly and yearly yields of milk and butter fat produced by their cows, under the rules and regulations of the several national cattle clubs. The rules require that these tests be made under the strict supervision of an officer of the Agricultural College or Experiment This department has undertaken the work for Massachusetts breeders. Considerable more testing has been required during 1905 than heretofore, necessitating the temporary employment of 5 different inspectors at one time. is frequently quite difficult and time-consuming for the regular employees to be required to meet the sudden demands of breeders for men to do work of this character, although thus far all calls for men and apparatus have been met promptly. Breeders ought to give the station at least ten days' notice. The cost of this work is paid by the parties for whom it is done, and includes tester's time at \$2 to \$2.50 a day, board, travelling expenses and breakage. There are at present 44 Jerseys and 29 Guernseys under yearly tests, belonging to F. L. Ames, North Easton, N. I. Bowditch, Framingham, W. L. Cutting, Pittsfield, C. II. Jones, Wellesley Farms, A. H. Sagendorph, Spencer, Storrs Agricultural College, Storrs, Conn., C. I. Hood, Lowell, A. F. Pierce, Winchester, N. H., and R. A. Sibley, Spencer. Eight seven-day milk and butter fat tests have been made for the Jersey Cattle Club, and 37 for the Holstein-Friesian Association, and the yearly tests of 32 Jerseys and 12 Guernseys have been completed.

9. Work completed.

Enreka Silage Corn. — A two-years experiment, to study the composition, digestibility and economic value of this corn, a coarse southern dent, as compared with a medium dent that will mature its seed in our latitude, has been completed, and the details and conclusions reported in Part II. of the present report.

The Value of Wheat Bran. - The results of a study of the

cost of digestible protein and total digestible matter in wheat bran, as well as the use of bran in the farm economy, are presented quite fully in Part II.

Bibby's Dairy Cake. — Digestion tests and an experiment with dairy cows have been completed with this feed. The details of the experiment, and the conclusions, will be found as a portion of Part II.

Market Milk, its Production and Composition. — This department has investigated the conditions governing the production of milk in the territory supplying Amherst and Northampton, as well as the chemical and bacteriological composition of the milk. It is believed that the methods of production and the quality of the product are much the same as in other sections of the State. In general, it may be said that:—

- 1. The sanitary conditions on the whole were unsatisfactory.
- 2. The majority of producers were not familiar with, or did not apply, the teachings of modern dairy principles.
- 3. The chemical composition of most of the milk was above the Massachusetts standard.
- 4. A great deal of the milk contains an excess of bacteria, and indicated unsanitary methods of handling.
- 5. The milk was practically all retailed at 6 cents a quart,—a price too low to enable the producer to profitably produce an article under satisfactory sanitary conditions.

It is believed that producers supplying milk for human consumption should be subject to a system of regular, competent inspection, and that no one should receive a license who does not conform to reasonable sanitary conditions. The public needs to be educated relative to the great food value of milk, and ought to be willing to pay a fair price for an approved article. It is hoped to soon publish the detailed results of this investigation in bulletin form.

Digestion Experiments with Sheep.—There have been completed digestion experiments with soy bean fodder, Eureka corn fodder and Eureka corn stover, Pride of the North corn stover, Blomo feed for horses, malt sprouts, Sucrene, Holstein and Macon sugar feeds, hominy feed,

buckwheat and oat middlings. The results have been incorporated in the tables of digestion coefficients, in the Appendix. The details of these experiments and a discussion of the results are reserved for a future publication.

Sorghum and Other Forage Crops. — Trials of a variety of green crops for summer soiling are conducted each year. Sorghum has been given particular attention for the last two years. A very complete analysis of this crop has been made at different stages of growth, and, likewise, digestion trials with sheep, the results of which are not as yet completed. The seed 1 was sown broadcast at the rate of 1 bushel per acre, the 25th of May. Cutting was begun as soon as the heads appeared (about August 10), and the yield was at the rate of 19 tons to the acre. The animals ate it well, and it should prove a satisfactory addition to the list of green feeds. A more detailed statement concerning the quality and value of this crop for soiling will be given in a future publication.

The station has found the following crops quite satisfactory for soiling purposes: peas and oats, the first seeding to be made April 25 and each ten days thereafter, ready to cut from June 25 to July 20; barnyard millet, first seeding to be made May 25 and another seeding two weeks later, ready for feeding from July 20 to August 10; sorghum to be seeded May 25, ready to cut August 10 to 30; Stowell's Evergreen sweet corn, or Longfellow field corn, seeded May 15 to 20, will serve admirably for September green fodder, and later if frosts are not severe.

Soy beans may be sown with the corn, but it is believed that, on the whole, more satisfactory results can be obtained by cultivating each crop separately. It is hoped to publish a bulletin on the subject of soiling in the near future. Copies of a former bulletin on this subject (No. 72) are not available.

Useful Legumes.—A study has been made of the composition, digestibility and yields of the more prominent leguminous crops, with a view to determine their practical adaptability to New England conditions, and it is desired

¹ Seed purchased of Wm. Henry Maule, Philadelphia, Pa., at \$2.25 a bushel.

to publish a concise description of this work in the near future.

Clover is unquestionably the most valuable legume, serving admirably as a soil renovator, cover crop, soiling crop, and as a component of the hay crop. Canada peas are valuable chiefly for soiling purposes, and in some cases as a cover crop. Sand vetch (Vicia sativa) makes a good legume to be sown in the autumn with wheat for early summer soiling. It also serves as a soil renovator and as a cover crop. Shammel, in Bulletin No. 149 of the Connecticut Experiment Station, has called attention to the value of this plant when sown after the removal of tobacco. It blossoms about June 1, and can then be plowed under, adding materially to the humus and nitrogen content of the soil. seeds poorly, and the seed is very expensive, which will naturally much restrict its use. Alfalfa has been tried repeatedly on the station ground under favorable conditions, but it has not as yet proved a satisfactory crop for practical purposes. It is affected with "leaf-spot," winter-kills, and is crowded out by clover and grasses. Occasionally one hears of successes by Massachusetts farmers. It is suggested that our farmers try it in a small way (1/4 acre), and see if it will thrive in their locality. Soy beans (Brooks's medium green) and several varieties of cow peas have been carefully studied; the latter are best suited to a more southern climate. The soy beans thrive well in Massachusetts, and may be used with satisfaction as a soiling crop, and mixed with corn for silage purposes. It is believed, however, that it will prove more economical, as a rule, for farmers and dairymen possessing satisfactory markets and railroad facilities to purchase their protein in the form of high-grade concentrates, rather than attempt to grow it in the form of soy bean forage or seed. Soy beans may prove an economical crop for localities situated at some distance from markets and railroads.

Compilation of Analyses. — Attention is called to the tables of composition and digestion of American feed stuffs, recently compiled, and published in the Appendix to this report.

10. Work in Progress.

Molasses and Molasses Feeds. — Work is in progress to determine the digestibility and comparative value and place in the farm economy of Porto Rico molasses and molasses feeds. Feeds of this character are being freely advertised and sold in our local markets. It is hoped to bring this work to a close early in the new year, and to report the results in bulletin form within a short time thereafter.

Nitro-cultures for Legumes. — The United States Department of Agriculture has called attention to the value of the cultures produced by its expert, Dr. Moore, for the different leguminous crops. Hellriegel of Germany was the first to scientifically demonstrate the symbiotic action of bacteria with the legumes, resulting in the fixation of atmospheric This subject has been given a great deal of study by many other scientists, particularly by Nobbe and his coworkers, who have isolated and prepared cultures suited to the different varieties of legumes. Moore claims that he has succeeded in isolating and developing varieties of bacteria that are especially active as nitrogen gatherers. department has secured the Moore cultures for two years, and used them upon alfalfa, soy beans and cow peas. directions were carefully followed in all cases, but no particular results were obtained that could be attributed directly to the action of the applied cultures. The yields for the soy bean and cow pea plots receiving the cultures were no greater than those not receiving them, neither did the plots thus treated show any noticeable increased nodular development. A newly seeded piece of alfalfa, inoculated with soil from an old alfalfa field, seemed to receive a decided help from the treatment, judging from the growth and apparent vigor of the plants. The writer would in no way condemn the Moore cultures, knowing the progress that has been achieved by numerous investigators along this line. Farmers may try the Moore cultures in a small way, but should not be disappointed if the results are not as expected. The daily press and popular journals have made altogether too extravagant statements and claims regarding them. Work of this character still requires much study before the highest practical results are secured.

11. Changes in Staff.

Albert Parsons, B.S., for two years employed as inspector of concentrated feeds and of Babcock machines, resigned July 1, to accept a position as assistant superintendent at Hood Farm, Lowell, Mass. His place has been filled by the appointment of Frank G. Helyar, B.S., University of Vermont, 1905. Joseph G. Cook, B.S., assistant in animal nutrition, resigned August 1, to become superintendent of the farm at Norfolk, Mass., belonging to T. D. Cook & Co. Roy F. Gaskill, a recent graduate of the Massachusetts Agricultural College dairy course, succeeds him. E. S. Fulton, B.S., assistant chemist, severed his connection with this department September 15, having received an appointment with Dr. F. G. Benedict of Wesleyan University of Middletown, Conn., who has charge of the nutrition investigations for the United States Department of Agriculture. Mr. A. C. Whittier, B.S., University of Maine, 1905, has taken Mr. Fulton's place. The writer desires to express his highest appreciation of the faithfulness, interest and care exercised by all his co-workers in the prosecution of the various lines of work undertaken by this department during the past vear.

PART II. - EXPERIMENTS IN ANIMAL NUTRITION.

1. Bibby's Dairy Cake.

J. B. LINDSEY.1

Nature and Composition of the Cake.

This material is made by J. Bibby & Sons, Liverpool, Eng., and is imported in the form of cake. It is composed chiefly of ground cotton-seed, together with locust or carob bean,² cereals (maize, wheat, etc.) or their by-products, fenugreek and salt; it possesses a pleasant taste and smell. A number of samples have been found that were quite mouldy, having probably been stored in a damp place. The sample used in the feeding experiment herein described had the following composition:—

					Bibby's Dairy Cake.	Standard Wheat Middlings for Comparison.	Gluten Feed for Comparison.
Water,					11.96	10.00	9.69
Ash,					7.89	4.30	1.40
Protein,					17.99	18.00	23.55
Fiber,					7.91	7.00	7.15
Extract	mat	ter,			45.05	55.70	55.08
Fat,					9.20	5.00	3.13

The cake has a high ash percentage, due partly to the presence of added salt, a moderate amount of protein and

¹ With E. B. Holland, P. H. Smith and J. G. Cook.

² The locust or carob tree is cultivated in Spain, the eastern Mediterranean regions and Egypt. The pods contain considerable quantities of sugar, and are caten by both men and animals.

fiber, and quite a noticeable per cent. of fat. It is guaranteed to contain 18 to 20 per cent. of protein and 6 to 8 per cent. of fat, and usually meets these requirements. not been found to be very generally distributed.

Digestibility of Bibby's Dairy Cake.

The average results of six single trials with sheep are here given, together with the coefficients for standard wheat middlings and gluten feed for comparison. The full details of the digestion experiment have been reported in the seventeenth report of this station.

Coefficier	its of	Digestr	ibility.
	Bibby	's Dairy	Standard

			Bibby's Dairy Cake.	Standard Wheat Middlings for Comparison.	Gluten Feed for Comparison.
Dry matter, .			70	73	85
Ash,			33	25	_
Protein,			66	77	85
Fiber,			31	30	76
Extract matter,			81	78	89
Fat,			92	88	83

In the several trials with Bibby's dairy cake the sheep experienced considerable difficulty in digesting the crude fiber, due probably to the fact that it was derived largely from cotton-seed hulls. It may be said that the total cake proved moderately digestible, the fiber having a low and the fat a high digestibility. Both in chemical composition and in digestibility Bibby's dairy cake closely resembled standard wheat middlings. Gluten feed contains 5 to 6 per cent. more protein, and is more digestible than the cake.

Cost of Digestible Matter.

	Bibby's Dairy Cake.	Standard Wheat Middlings.	Gluten Feed.
Pounds digestible matter in 2,000 pounds. Cost of one pound (cents),	1,232 2.43	1,314	1,550 1.72

The above figures are based on the average wholesale prices of middlings and gluten feed for the year 1904, plus 10 per cent.; namely, \$26.70 for middlings and \$27.72 for gluten feed. Bibby's dairy cake cost \$30 a ton. The calculations show that a ton of wheat middlings furnished rather more digestible matter than a ton of Bibby's dairy cake, and at a somewhat less cost a pound. They further show that, if 1,550 pounds of digestible matter in a ton of gluten feed could be purchased for \$27.72, 1,232 pounds, being the quantity contained in a ton of Bibby's dairy cake, ought not to cost over \$22. In other words, Bibby's dairy cake at \$30 a ton furnishes digestible matter at some 37 per cent. advance over that contained in gluten feed at \$27.72 a ton.

Feeding Experiment with Bibby's Dairy Cake, Spring, 1904.

In order to test the efficacy of this cake as a food for milk production, four cows were divided as evenly as possible into two groups, and fed by the reversal method. All of the cows received first-cut hay, rowen and bran as a basal ration. In the first half, two of the cows received a definite quantity of the dairy cake and the other two a like quantity of gluten feed; in the second half, these two grain feeds were reversed.

Duration of E	'xperiment.
---------------	-------------

Pe	Periods.		DATES.	Gluten Feed Ration.	Bibby's Dairy Cake Ration.
I., II.,			May 7 through May 27. June 4 through June 24.	Red II. and Brighty. Linnie and Blanche.	Linnie and Blanche. Red II. and Brighty.

Care of the Animals.—The cows were kept in roomy stalls, well carded, and turned into the yard some six or more hours each pleasant day.

Method of Feeding. — The animals were fed twice daily, the hay being given about an hour before milking, and the grain mixtures just before milking. The several grains were well mixed before being fed. Bibby's dairy cake was ground to the fineness of ordinary meal. Water was supplied the animals constantly by means of a self-watering device.

Character of Feeds. — The first-cut hay was a mixture of Kentucky blue-grass, timothy and red clover. The rowen was a mixture of second growth of grass and red clover, secured in good condition. The spring bran, gluten feed and Bibby's dairy cake were of good average quality.

Weighing the Animals.—The animals were weighed for three consecutive days at the beginning and end of each half of the trial.

Sampling Feeds. — The hay and rowen were sampled at the beginning, middle and end of each half of the trial, dry matter determinations made at once, and the several samples mixed for analysis. The grains were sampled daily, and preserved in glass-stoppered bottles. The cows received two ounces of salt daily.

Sampling the Milk. — The milk of each cow was sampled twice daily for five consecutive days of each week, and preserved with formaline in tightly corked bottles. The method of sampling consisted in mixing the freshly drawn milk with an especially constructed mixer, and immediately removing a small dipperful. Determinations of fat were made weekly, and solids every other week.

Average, gluten feed ration. Average, Bibby's dairy cake ration.		15.75 15.75	6	3.25 3.25	3.5	3.5

It will be seen that the cows received the same basal ration daily, and in addition averaged 3.5 pounds of gluten feed or dairy cake.

Average Dry Matter and Digestible Organic Nutrients in Daily Ration (Pounds).

Ration.	Dry Matter.	Digi	WT 4 14 1				
		Protein.	Fiber.	Extract Matter.	Fat.	Total.	Nutritive Ratio.
Gluten feed, average, .	24.99	2.36	4.15	7.73	.35	14.59	1: 5.4
Bibby's dairy cake, average.	24.91	2.07	3.96	7.27	.36	13.86	1: 6.0

The two rations furnished the same quantity of total dry matter daily. The Bibby's dairy cake ration contained rather less protein and about three-fourths of a pound less total digestible matter. This was due principally to the fact that Bibby's dairy cake was less digestible than the gluten feed. It would naturally be expected that Bibby's dairy cake ration would produce rather less milk, or cause the animals to shrink somewhat in live weight.

Total Yields of Milk Products (Pounds).

RATION.	Total Milk.	Average Daily Yield.	Total Solids.	Total Fat.	Butter Equivalent 85 Per Cent.
Gluten feed,	1,860.04	22.14	256.12	89.89	105.75
	1,830.01	21.79	251.20	90.00	105.88

The yields obtained from the two rations, covering a period of twenty-one days in each case, were practically identical. If the periods had covered twice the length of time, the results would have been regarded as more satisfactory. Longer periods were not practicable, owing to the condition of the animals and the nearness of summer weather.

 $Average\ Composition\ of\ the\ Herd\ Milk.$

	R	ATION				Total Solids (Per Cent.).	Fat (Per Cent.)
Gluten feed,						13.77	4.83.
Bibby's dairy cake,				۰		13.73	4.92

The two rations produced milk having practically the same composition.

Food Cost of Milk Pr	roducts.
----------------------	----------

RATION.	Total Milk.	One Hundred Pounds Milk.	One Pound Butter.	
Gluten feed,	\$20 85	\$1 12	\$0 20	
Bibby's dairy cake,	22 03	1 20	21	
Percentage increased cost with Bibby's dairy cake.	5.66	7.14	5.00	

In calculating the above results, gluten feed was charged at \$27.72 a ton, Bibby's dairy cake at \$30, bran at \$20, hay at \$15 and rowen at \$14. The increased cost of the milk and butter produced by the Bibby's dairy cake ration was due to the price asked for Bibby's dairy cake.

Herd Gain or Loss in Live Weight.

	R	ATIO	N.				Total Gain or Loss.
Gluten feed,							43+
Bibby's dairy cake,							2 —

There appeared to have been a slight gain in live weight produced by the gluten ration. During the Bibby's dairy cake period the weight remained constant.

Conclusions.

- 1. Bibby's dairy cake, a manufactured product, resembles in chemical composition and digestibility standard wheat middlings. It has a sweet taste and an agreeable flavor and odor, due to the presence of the carob bean, fenugreek and salt.
- 2. It was found to contain slightly less digestible matter than middlings, and some 20 per cent. less than gluten feed. On the basis of digestible matter contained in the Bibby's dairy cake and in first-class gluten feed, the former should sell for 20 per cent. less a ton.
 - 3. While the cake is readily eaten and highly relished by

all farm animals, it is believed that the agreeable flavor and odor do not make it worth the extra price asked.

- 4. In the feeding experiment, lasting twenty-one days, the four cows produced practically as much milk on the Bibby's dairy cake as on the gluten feed ration; the latter ration produced a slight gain in live weight. The cost of milk and butter was noticeably more on the Bibby's dairy cake ration. The experiment indicates that the Bibby's dairy cake ration furnished a sufficient quantity of digestible matter to meet the requirements of the several cows. Had the periods been longer, and the cows in a less advanced period of lactation, it is believed the differences would have been more striking.
- 5. Bibby's dairy cake, at prevailing market prices, is not regarded as an economical concentrate; it can be used, however, if desired, as the exclusive grain ration for sheep, young dairy stock and milch cows. From 5 to 8 pounds would be the usual daily allowance for the latter animals. Its chief use should be as an appetizer, to be mixed in small quantities with foods that, because of an inferior flavor, would not be otherwise readily consumed.

From the standpoint of economy, farmers will do well to produce their hay, silage and corn meal, and to purchase only those manufactured concentrates that are rich in protein, such as cotton-seed meal, gluten feed, distillers' and brewers' dried grains, wheat middlings and bran.

2. Eureka Silage Corn, — its Value for Massachusetts Farmers.

J. B. LINDSEY AND P. H. SMITH.

This corn is said to have originated in Virginia. It is a large southern dent, and is considerably used for silage purposes by New England farmers.

Brooks ¹ of this station compared a number of dent varieties during the season of 1901. The Eureka grew to be 15 feet high, appeared to be quite heavily leaved, and when cut, September 14, the ears were just forming. This variety yielded rather heavier than the others, producing at the rate of 24 tons to the acre, containing 8,944 pounds of dry matter. Its digestibility was not determined. Brooks concluded that the heavy dents were not as satisfactory as the smaller varieties for New England conditions. At the solicitation of Ross Bros. of Worcester, who recommend and sell the Eureka seed for silage purposes, this department has made a more thorough study of the Eureka, and briefly presents the results and conclusions in the following pages.

Crop of 1903.

One-fourth acre of medium well-drained loam, in a good state of fertility, was treated with manure from well-fed dairy cows, at the rate of 6 cords to the acre. The manure was plowed in, and the land well fitted and seeded May 26, with Eureka corn, obtained of Ross Bros. The seed came up well, and the corn made as good growth as could be expected during the exceptionally cool season. Frosts held off until nearly the 1st of October, and the corn was allowed to grow until September 25, in order to insure a maximum

¹ Fourteenth annual report of the Hatch Experiment Station, pp. 32-34.

development. At that time it averaged 11½ feet in height, the ears had formed, and the kernels were just beginning to develop. When cut, it contained 82.6 per cent. of water, and yielded at the rate of 15 tons of green material to the acre.

Crop of 1904.

One-third of an acre of well-drained, light loam was plowed, manured at the rate of 6 cords to the acre and well The area was divided into two halves, and planted with Eureka and Sibley's Pride of the North corn, the latter a medium dent that will mature its seed in our latitude. Some of the seed failed to germinate, more particularly the Eureka, which necessitated some replanting. When the corn was 15 inches high it was thinned to about one stalk to the foot. The area was kept well cultivated and free On July 12 the corn was growing fast and from weeds. looked healthy, the Eureka being the taller. August 15 the Pride of the North was well tasseled and silked, while the Eureka tassels were just showing. The corn was cut September 15, at which time the Pride of the North averaged 9 to 10 feet in height and was fairly ripe, with kernels glaz-The Eureka was 12 to 13 feet high and quite immature. the ears being small and the kernels scarcely formed. plats, each 175 by 35 feet, were cut, stooked and eventually carried to the barn and carefully weighed. The Eureka yielded 936 pounds of dry matter, equal to 6,683 pounds per acre, equivalent to 20.4 tons of green corn (83.6 per cent. water); the Pride of the North yielded 877 pounds of dry matter, equal to 6,262 pounds per acre, equivalent to 13.9 tons of green corn (77.5 per cent. water).

Composition of Green Corn (Per Cent.).

		100.00	100.00	100.00	100.00	100.00	100.00	100.00		

¹ When cut in autumn.

The differences in the composition are much more noticeable with the water eliminated. The Eureka (whole plant) contained decidedly more ash and fiber, rather more protein and much less extract matter than the Pride of the North.

The analyses show that the Pride of the North had reached a more advanced stage of development than the Eureka, and consequently contained a much larger proportion of starchy matter. The stover from the two varieties was quite similar in composition.

Percentage of Water in Field-cured Material.

Eur	ška.	PRIDE OF THE NORTH.					
Whole Plant.	Stover.	Whole Plant.	Stover.				
59.921 68.922	62.893	37.844	18.135				

After being cured in barn for six months, 1903.

The field-cured Eureka still continued to contain a high moisture content, due probably to its immaturity and to its unusually coarse, porous stems.

² After being housed in barn until March.

² As it came from field, 1904.

⁸ After being in barn about a month, 1904.

⁴ As it came from field, 1904.

⁵ After being in barn about three months.

The Pride of the North had about the usual water content for matured corn that had been field cured. These figures show that in a ton of dried Eureka fodder, as drawn to the barn, there would be 1,380 pounds of water and 620 pounds of dry matter; and in a ton of Pride of the North there would be 757 pounds of water and 1,243 pounds of dry matter; in other words, each ton of Pride of the North would have twice the feeding value of Eureka, without taking into consideration the superior nutritive character of the dry matter, which will be alluded to under another heading.

The corn stover derived from the two varieties likewise showed marked differences in the water percentage present. The barn-cured Pride of the North stover was exceptionally dry.

Composition of Parts of Corn (Per Cent.).

[Dry Matter.]

		LEA	VES.	STA	LKS.	EA	RS.	Husks.		
		Eureka.	Pride of the North.							
Ash, .		8.98	9.42	5.42	5.81	3.25	1.95	3.02	3.17

Fiber, .		28.43	25.00	35.77	31.94	19.47	11.37	24.64	27.32	
Extract,		45.63	47.63	52.94	56.82	63.84	73.65	62.22	62.70	
Fat, .		2.43	3.42	1.07	.88	1.44	3.21	1.46	1.41	
		100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00	

The samples were taken immediately after the corn was cut (September 15), dried at a low heat, and preserved in glass-stoppered bottles. The leaves of the two varieties were similar in composition, and are the most valuable parts of the plant, aside from the ears. The stalks of the Eureka were characterized by containing more fiber than the other variety. The ears produced by the Eureka contained rather more protein and ash, decidedly more fiber and noticeably less fat and extract matter than those yielded by the Pride of the North. The analyses make clear that the ears obtained from the Eureka were quite imperfectly developed. The composition of the husks was more uniform.

Digestibility of the Corn.

The first digestion experiment was made in the autumn of 1903, with the Eureka green corn. Another experiment was made with the same corn, after it had been cured and housed for six months. Unfortunately, a digestion test was not made with the Pride of the North (whole plant). During the autumn of 1905, therefore, another sample of this variety was tested for digestibility. It was fully developed and well eared. Other experiments were made to test the digestibility of the stover of each of the two varieties produced in 1904. The several tests were made with the same sheep in each case, the results of which follow:—

	Eur	EKA.	Pride of the		Pride of the
	Green, 1903 (Three Sheep).	Dry, 1903 (Two Sheep).	North, Green, 1905 (Two Sheep).	Eureka, Stover, 1904 (Two Sheep).	North, Stover 1904 (Two Sheep).
Dry matter,	67	64	71	54	54
Ash,	42	40	34	45	31
Protein,	67	57	63	48	45
Fiber,	60	72	65	59	60
Nitrogen-free extract,	72	64	77	53	54
Fat,	66	62	76	67	64

The green Eureka fodder (whole plant) and the same material dried showed only slight variation in the digestibility of total dry matter. The results correspond closely with those obtained by other experimenters with large southern varieties at a similar stage of growth. For some reason the fiber in the dry material was more fully digested than in the green substance, and the protein and extract matter less so. The Pride of the North (whole plant) proved to be rather more digestible than the Eureka, due to the fact that it was well eared. The digestible material in the Pride of the North, because of its content of matured grain, would naturally yield more net available energy than a like amount of digestible matter derived from the Eureka. The corn stover (all ears removed) from each of the two varieties appeared to be equally well digested.

Summary of Yields.

A definite quantity of each of the two varieties of green material was separated into husks, ears, leaves and stalks, in order to determine the relative proportions of each. The figures show percentages or pounds in 100.

(a)	Yield	of	Parts.

			- 1		EUREKA.		PRIDE	OF THE N	VORTH.
	Part	rs.		First Trial.	Second Trial.	Average.	First Trial.	Second Trial.	Average.
Husks, .				6.50	8.00	7.25	10.25	11.25	10.75
Ears, .				6.25	8.25	7.25	21.25	23.00	22.11
Leaves, .				22.75	21.75	22.25	20.00	20.00	20.00
Stalks, .				65.00	62.25	63.62	47.50	46.00	46.75
				100.50	100.25	100.37	99.00	100.25	99.67

The results are in accordance with the teaching of the analytical data. The Eureka showed only 7.25 per cent. of ears, while the Pride of the North contained 22.11 per cent. The Pride of the North variety consisted of 46.75 per cent. of stalks, and the Eureka 63.62 per cent. The Eureka, even at its less advanced stage of growth, contained only slightly more leafy matter than the Pride of the North.

(b) Yield per Acre (Pounds).

		EURE	EKA.	Pride of the
		1903.	1904.	North, 1904
Green material,	.	30,000	40,800	27,800
Dry matter,		5,220	6,691	6,255
Estimated digestible matter,		3,497 1	4,483 1	4,441 1

Obtained by allowing 67 per cent. of the dry matter to be digestible in the Eureka, and 71 per cent. in the Pride of the North, as determined by actual experiment.

The above results indicate strongly that the Eureka, although a larger variety, yielding considerable more green material than the Pride of the North, is not likely to furnish any more actual food to the acre. In the present instances,

the party drawing the product of an acre of green Eureka corn to the barn would be transporting 34,109 pounds of water and 6,691 of dry matter, while in the case of the Pride of the North he would cart 21,545 pounds of water and 6,255 pounds of dry material; in other words, to secure essentially the same quantity of actual food in the Eureka he would be required to handle 12,564 pounds extra water.

It is, of course, understood that the yield would vary from year to year, depending on soil and climatic conditions. It is believed, however, that the relative proportions would hold true, and that the farmer would secure as much actual food material from those varieties of corn that mature their seed, without being obliged to handle the extra bulk in the form of water.

Conclusions.

- 1. Eureka silage corn is a late dent variety; it has large stalks, which appear to be thickly set with leaves. During the seasons of 1903 and 1904 it grew 11 to 13 feet high, and when cut, September 15, the ears were very immature (kernels just forming).
- 2. In comparison with Sibley's Pride of the North, a medium dent, which matures its ears in this latitude, the Eureka green corn, when cut, contained about 6 per cent. more water, noticeably more ash and fiber, and much less extract matter. The field-cured fodder of the Eureka still contained as high as 69 per cent. of water, while the Pride of the North contained only 38 per cent.
- 3. The leaves and husks of each variety did not vary greatly in composition. The ears and stalks of the Eureka contained more fiber and much less extract matter and fat than those of the Pride of the North.
- 4. The Eureka green fodder was found to be 67 per cent., and the same material dry 64 per cent., digestible; a typical sample of Pride of the North, cut green, was 71 per cent. digestible. The stover of both varieties proved equally digestible.
- 5. The Eureka yielded about the same relative weight of green leaves as did the Pride of the North. It produced 64 per cent. of stalks and 7 per cent. of ears, while the Pride

of the North yielded 47 per cent. of stalks and 22 per cent. of ears.

- 6. The Eureka produced at the rate of 20 tons of green fodder, and the Pride of the North 13 tons of green fodder, to the acre. The latter, however, contained nearly as much dry and digestible matter (actual food material) as did the former. The excess yield of Eureka green corn, therefore, consisted of water.
- 7. Had the seasons of 1903 and 1904 been more favorable to the growth of corn, it is probable that both varieties would have produced larger yields. It is very doubtful, however, if the Eureka would have matured its grain.

The writer, therefore, thinks it unwise to grow such late dents as the Eureka, and believes the northern farmer will secure better feed for less money by holding fast to those varieties that will mature not later than September 10 or 15.

It is well known that immature corn, such as the Eureka, undergoes more serious decomposition when ensiled than do well-matured varieties, which would still further detract from its nutritive value.

3. Concerning Wheat Bran.

J. B. LINDSEY.1

(1) Introduction.

Until within comparatively recent times, wheat bran and corn meal have formed the two staple concentrated feeds for dairy stock, and in spite of the large variety of concentrates now in the market, the former still continues to be used largely by the great majority of dairymen in our eastern States. The reasons for this are not difficult to find. good quality of bran is uniformly palatable; it can be fed in considerable quantities without producing any ill effects; it acts as a slight laxative; it furnishes more digestible protein than corn; and it serves as a very satisfactory diluter or distributer of the heavy concentrates, such as the glutens, cotton-seed meal and flour middlings. It is believed, however, that the nutritive material contained in bran can be purchased more cheaply in other concentrates, and that New England farmers often use more of it than economy warrants.

Attention is called in the present paper to the composition, digestibility, cost of digestible matter and the fertilizer ingredients in bran, as compared with other concentrated feeds, and likewise to experiments I. and II., in which corn silage is compared with wheat bran as a distributer of the heavy concentrates. Note particularly the brief discussion of the results, at the end of the article.

¹ With E. B. Holland, P. H. Smith and J. G. Cook,

(2) Average Composition of Concentrates.

						Fo	R COMPARIS	ON.	
Ingredier	NTS.			Wheat Bran.	Cotton- seed Meal.	Gluten Feed.	Distillers' Dried Grains.	Brewers' Dried Grains.	Malt Sprouts.
Water,				10.00	7.00	8.50	8.00	8.00	11.00
Ash,				6.40	6.50	1.70	1.70	3.80	5.80
Protein, .				16.00	45.10	26.50	33.00	23.10	27.10
Fiber,				10.00	6.10	7.20	13.10	10.80	11.80
Extract matter	(st	arch	y),	53.00	24.20	53.10	32.40	49.40	42.90
Fat, .				4.60	11.10	3.00	11.80	4.90	1.60

Wheat bran contains noticeably less protein than any of the other important by-products. Nitrogen-free extract matter usually is the fodder group next in value to the protein. The quantity contained in bran is approximately equal to that found in gluten feed, and not greatly in excess of the percentage in brewers' grains and malt sprouts. Most of the several feeds enumerated contain about similar fiber percentages.

(3) Digestibility of the Concentrates.

The figures in the following table show the pounds of digestible fodder groups contained in one ton of the several feeds.

Wheat bran is shown to contain rather less total digestible matter and noticeably less digestible protein than any of the several feeds tabulated. The two carbohydrate feeds, corn and hominy meals, are naturally deficient in protein, but very rich in digestible starchy matter and fat.

¹ The quantity of extract matter in cotton-seed meal is quite small, due to the exceptionally high protein percentage.

Organic Matter digestible in 2,000 Pounds.

Protein,			INGRE	REDI	DIENTS.				Wheat Bran.	Cotton-seed Meal.	Gluten Feed.	Brewers' Dried Grains.	Malt Sprouts.	Distillers' Dried Grains.	Corn Meal.	Hominy Feed.
	Protein, .							•	254	800	440	364	434	448	130	142

	Fat,							•	09	196	20	06	35	206	09	152
	Totals, .							•	1,104	1,362	1,564	1,142	1,124	1,334	1,518	1,448

Retail Cost of One Pound of Digestible Matter.

	Spring and Winter Bran. 1901 to 1904.	Cotton-seed Meal. 1901 to 1904.	Gluten Feed. 1901 to 1904.	Distillers' Dried Grains. 1904 to July, 1905.	Brewers' Dried Grains.	Malt Sprouts. 1904 to July, 1905.	Corn Meal. 1901 to 1904.	Hominy Meal. 1901 to 1904.
Market price per ton,	\$22 48	\$29 17	\$26 05	\$27 00	\$22 50	\$21 00	\$26 12	\$25 03
Cost of one pound of digestible matter (cents), $\ .$	2.04	2.15	1.67	2.03	1.97	1.87	1.70	1.72
			-					

The above figures are quite instructive. They show that digestible matter in bran, cotton-seed meal and distillers' and brewers' dried grains has cost about the same for a number of years, while in the form of malt sprouts the price has been somewhat less.¹ Corn and corn by-products (gluten and hominy feed) have furnished digestible matter for uniformly less money than it could be purchased for in the form of either bran, cotton-seed meal, distillers' or brewers' residues.

Retail Cost of Digestible Protein.

[Allowing 1 cent for digestible carbohydrates, .5 cent for digestible fiber and 2.25 cents for digestible fat.]

	Spring and Winter Bran. 1901 to 1904.	Cotton- seed Meal. 1901 to 1904.	Gluten Feed. 1901 to 1904.	Distillers' Grains. 1904 to July, 1905.	Brewers' Grains. 1904.	Malt Sprouts. 1904.
Market price per ton, .	\$22 48	\$29 17	\$26 05	\$27 00	\$22 50	\$21 00
Cost of one pound of digestible protein (cents).	5.40	2.72	3.00	3.65	3.91	3.25

Cotton-seed meal furnishes digestible protein for the least money, gluten feed standing next in order, while protein in the form of wheat bran is decidedly expensive. Naturally, carbohydrate feeds, corn and the like, are not economical sources of protein.

(4) Fertilizing Ingredients in a Ton of Concentrates.

			Wheat Bran.	Cotton- seed Meal.	Gluten Feed.	Distillers' Grain.	Brewers' Grains.	Malt Sprouts.
Nitrogen,			51	144	85	106	74	86

Percentage valuation	on	of	54	103	62	73	68	88

Bran is quite rich in the mineral ingredients phosphoric acid and potash, being exceeded only by cotton-seed meal.

¹ The retail price of malt sprouts and brewers' dried grains has been rather difficult to ascertain, for the reason that comparatively small quantities are sold in Massachusetts markets.

The corn by-products (gluten feed and distillers grains) contain only a trace of potash. The money valuations are based on current market prices, namely: nitrogen, 18.5 cents; potash, 4.25 cents; and phosphoric acid, 4 cents a pound. The fertilizing elements in the several feeds are in as desirable a form as those in the best grades of unmixed fertilizing stock. Bran is shown to contain fertilizer ingredients equal to 54 per cent. of its cost, and cotton-seed meal is fully equal to its cost; the others are considerably in excess of the bran.

It is not to be inferred that after the several feeds have passed through the animal their fertilizing ingredients have as high a money value as before they were consumed. In fact, some 20 per cent. has been retained by the animal, more or less loss has unavoidably occurred in the manurial residue, and they are in a much more bulky condition, which requires considerable additional labor to apply them. Nevertheless, the figures show clearly that the combined fertilizer ingredients in bran have noticeably less value than in any of the other by-products.

Conclusions.

- 1. Wheat bran contains noticeably less total as well as less digestible protein than any of the other nitrogenous byproducts.
- 2. The total digestible matter in bran is likewise less than in the other prominent concentrates; thus, cotton-seed meal contains 24 per cent. more, gluten feed 44 per cent., distillers' grains 21 per cent. and corn meal 38 per cent.
- 3. For several years past the cost of a pound of digestible matter in bran, cotton-seed meal, distillers' and brewers' dried grains has been about the same; it could be purchased in the form of gluten feed, corn and hominy meals for some 20 per cent. less.
- 4. A pound of digestible protein in wheat bran cost 100 per cent. more than in cotton-seed meal, 80 per cent. more than in gluten feed and 50 per cent. more than in distillers' dried grains.
 - 5. Because of its relatively low protein percentage, the

fertilizer ingredients in bran have from 10 to 50 per cent. less money value than those contained in the other byproducts.

6. The nutritive material and especially the protein contained in wheat bran must be regarded, therefore, as relatively expensive. Because of its palatability, its laxative effect and its desirability as a diluter or distributer of the heavy concentrates, it will continue to be used by many farmers as a portion of the grain ration for dairy stock. See practical deductions as to the use of bran, on page 223.

(5) Wheat Bran v. Corn Silage as a Distributer of the Heavy Concentrates.

EXPERIMENT I. SPRING, 1903.

Object of the Experiment. — Wheat bran has been shown to be an expensive feed, judged solely from the amount of nutritive material it contains. The present experiment was undertaken to see if silage would not serve as a distributer equally as well as bran. Such being the case, the farmer could use home-grown corn, or corn and cob meal, in place of an equal amount of bran, and, by feeding in addition a few pounds daily of cotton-seed meal and malt sprouts or flour middlings, get along with a minimum quantity of purchased grain.

Plan of the Experiment.—The cows, ten in number, were high-grade Jerseys. Eight had calved early the previous autumn, and two, Pearl and Red 2d, the preceding December.

The animals were divided as equally as possible into two lots of five each, and both herds fed for two weeks upon the so-called bran ration, consisting of silage, hay, cotton-seed meal, flour middlings and wheat bran. In the second period, lasting five weeks, one lot of cows, known as Herd I., continued to receive the same ration; and the other lot, Herd II., was fed the so-called silage ration, consisting of silage and hay, cotton-seed meal, flour middlings and corn and cob meal. In each of the two periods one week was considered preliminary.

In interpreting the results, it is proposed to note the weekly yields produced in the second period by both herds on different grain rations, as compared with the weekly yields of the first periods, when the two herds received the same grain ration, thus ascertaining the comparative efficacy of the two different grain rations fed in the second period. The yields obtained in the first period are to be used simply as a basis for comparison.

Duration of the Experiment.

Period I.

и., .	Silage as distributer,	Red II., Dora, Blanche, May, Daisy.	April 12-May 10.	4

¹ Preceded by preliminary period of seven days.

General Care of the Animals.—The experiment was carried out in the station barn, especially set apart for such work. Each animal was kept in a roomy stall, well carded, and turned daily into a yard for exercise. The cows were in good condition, and quite contented.

Method of Feeding.—The cows were fed twice daily, and water was before them constantly. In case of the bran ration, the several grains composing it were carefully mixed, and fed just before milking. The grains used in the silage ration—cotton-seed and corn meals and flour middlings—were likewise mixed, and the resulting combination quite thoroughly mingled with the silage by means of a four-tined fork, and fed previous to milking. One quart of the bran ration weighed .80 of a pound, and 1 quart of the grain ration fed with the silage weighed 1.4 pounds, the former being naturally much more bulky.

Character of the Feed Stuffs. — The bran was from spring wheat, the other grains were of the usual good quality. The silage, made from rather poorly eared corn, was of average The hay was largely Kentucky blue-grass, with some clover.

Weighing the Animals. — The animals were weighed on three consecutive days at the beginning and end of the second period.

Sampling Feeds. — The coarse fodders were sampled three times during the second period, dry matter determinations made immediately, and composite samples analyzed. samples of the grains were taken daily and placed in glassstoppered bottles.

Sampling Milk. — The milk of each cow was sampled twice daily for five consecutive days of each week of the two periods, and preserved with formaline in tightly corked The method of sampling consisted in mixing the freshly drawn milk with an especially constructed mixer, and immediately removing a small dipper full.

Average Ration consumed by Each Cow Daily (Pounds). First period: both herds, bran ration.

	Не	RD.		First Cut Hay.	Silage.	Bran.	Cotton- seed Meal.	Flour Middlings.	Corn and Cob Meal.
I.,			.	12.52	26.10	3.60	2.00	2.00	_

Π.,			13.60	29.00	-	2.10	2.10	3.80

Herd I. received practically the same quantity of grain and roughage daily in each period; the same can be said of Herd II. needed and received slightly more than Herd I. during both periods.

Average Dry and Digestible Daily Nutrients consumed by Each Cow (Pounds).

Herd I .: both periods, bran ration.

	PER	юD.	Dry Matter.	Protein.	Carbo- hydrates.	Fat.	Total.	Nutritive Ratio.
I.,			22.98	2.42	11.38	•69	14.49	1:5.4
Π.,			23.16	2.43	11.46	.69	14.58	1:5.4

Herd II.: first period, bran ration; second period, silage ration.

I.,		24.85	2.58	12.36	.74	15.68	1:5.4
II,		24.78	2.26	13.29	.73	16.28	1:6.5

Herd I. received the same quantity of digestible nutrients during both periods. Herd II. received more total digestible matter in the first period than did Herd I., but the nutritive ratio of the fodder groups was the same. In the second or silage period Herd II. consumed rather more total digestible nutrients than in the first period, but less digestible protein, the nutritive ratio being somewhat wider (1:6.5, instead of 1:5.4). This increase of digestible matter consumed was due to the higher digestibility of the corn and cob meal.

Weight of Animals at Beginning and End of Second Period (Pounds).

Average Weekly Yields of Each Herd (Pounds), and Percentage Gain or Loss.

H	eτ	d	I.

Periods.	Milk.	Solids.	Fat.	Butter Equivalent (85 Per Cent.)
I.,	798.0	111.2	40.3	47.4
п.,	820.4	116.1	41.7	49.1
Percentage gain or loss, II. over I.,	+2.8	+4.4	+3.5	+3.6
	Herd II.			
I.,	818.2	116.1	41.5	48.8
и.,	804.6	116.4	41.3	48.5
Percentage gain or loss, II. over I.,	-1.7	+.3	4	6

It will be seen that Herd I., which received the bran ration during both periods, made a slight gain during the second period in the quantity of milk and milk ingredients; while Herd II., which received the silage ration in the second period, underwent a slight loss. The differences are so slight as to prevent any positive conclusions. They indicate, however, that the bran ration produced slightly better results than the silage ration, due possibly to the excess of protein in the former ration.

Dry and Digestible Matter required to produce Milk, Milk Solids and Milk Fat.

Herd I.: both periods, bran ration.

						TTER REQU	TRED TO	DIGESTIBLE MATTER REQUIRED TO PRODUCE					
	P	ERIO	D.		One Hundred Pounds Milk.	One Pound Solids.	One Pound Fat.	One Hundred Pounds Milk.	One Pound Solids.	One Pound Fat.			
I.,			•		100.80	7.23	19.97	63.56	4.56	12.60			
ΙΙ.,	I.,				98.81	6.98	19.44	62.21	4.40	12.24			

Herd II: first period, bran ration; second period, silage ration.

I., .		106.32	7.49	20.98	67.04	4.73	13.23
и., .	٠	107.78	7.45	21.01	70.83	4.90	13.81

Herd I. required slightly less dry and digestible matter to make milk and milk ingredients in the second period. Herd II. took a little more dry and digestible matter in the second period to make a definite quantity of milk, milk solids and milk fat. On the basis of the above figures, it may be concluded that the bran ration produced a trifle better results than the silage ration.

Food Cost of Milk and Butter.

Herd I.: both periods, bran ration.

		PE	RIOD		One Hundred Pounds Milk.	One Hundred Pounds Butter.		
Ι,							\$1 03	\$17 33
11.,							1 01	16 81

Herd II.: first period, bran ration; second period, silage ration.

Ι.,										٠,	\$1 08	\$18 11
и.,											1 13	18 74
Pere	enta eriod	ge 1.	incre	ased	cost	t,	Period	11.	0	ver	+4.6	+3.5

The cost of milk and butter is based upon hay at \$15 a ton, silage at \$3.50, bran at \$22, corn and cob meal at \$26, cotton-seed meal at \$30 and middlings at \$25. The cost of milk and butter produced by Herd I. in both periods was nearly identical, and the slight variations may be attributed to experimental error. The increased cost of the milk and butter produced by Herd II. in the second period was due largely to the then existing excess cost of the corn and cob meal over that of the bran, and not to the feeding effect of the two rations.

Fertilizer Ingredients in Rations (Cost).

First period: Herd I bran ration

24.86 pounds	phosp	h ori e	acid,	valu	ed at					99
Total,									\$17	05

The total quantity and valuation of fertilizer ingredients were nearly identical in each ration.

Conclusions.

- 1. The animals were in good condition during the entire experiment, hence the silage proved equally as satisfactory as bran for distributing the heavy concentrates (cotton-seed meal and flour middlings).
- 2. The so-called bran ration produced a trifle more milk and milk ingredients than did the silage ration. Furthermore, it required a little less dry and digestible matter to make a definite quantity of milk ingredients with the former ration.
- 3. It cost several per cent. more to produce milk with the silage ration; but this difference was due primarily to the temporarily increased market price of the corn and cob meal, and not to the feeding effect of the ration.

EXPERIMENT II. - WINTER, 1904.

Object of the Experiment.—The object of this experiment was quite similar to the one already described; namely, to see if corn silage could not be employed in place of wheat bran as a distributer of the heavy concentrates.

Plan of the Experiment. — This experiment was conducted on the reversal plan. The cows were divided into two lots of four each. In the first half of the experiment one lot received the so-called bran ration at the same time the other lot received the silage ration. In the second half these conditions were reversed.

Duration of Experiment.

First Half.

Care of Animals and of the Product. — The general care of the animals and the method of feeding and of sampling the milk have been described in the preceding experiment. Each cow was weighed for three consecutive days at the beginning and end of each half of the experiment, the weighing being done in the afternoon before feeding and watering.

Character of the Feeds. — The weights of a quart of the two grain mixtures were about the same as those fed in the former experiment, the bran ration being much the more bulky. The bran was derived from winter wheat, and was light and flaky. Corn meal was used in place of corn and cob meal, the latter not being available. The cotton-seed meal and flour middlings were of the usual good quality.

The silage was largely corn, with a slight admixture of soy beans. The corn and soy beans were grown together, but, owing to the cool summer of 1903, the beans made a very light growth and produced scarcely any seeds. The corn, likewise, was poorly eared, and the total yield of the mixture was only about 8 tons to the acre. The silage was not at all decomposed or unduly acid, and was considered of fair quality. The hay was largely Kentucky blue-grass, of good quality, cut when in full to late blossom.

Rations consumed Daily (Pounds).

The average daily bran ration, consisting approximately of 14 pounds of hay, 31 pounds of silage (about a bushel), 3 pounds of bran, 2 pounds of flour middlings and 1 pound of cotton-seed meal, may be considered a good type of a dairy ration, and quite similar to combinations in use by many milk producers who buy all of their grain. It was the aim in preparing the silage ration to do away with the bran by substituting home-grown corn, and at the same time to produce a combination that would contain essentially the same quantity and proportion of digestible nutrients. This was accomplished by feeding 2.5 pounds of corn meal instead of 3 pounds of bran, and 1.5 pounds of cotton-seed meal in place of the 1 pound fed in the bran ration.

Assuming that the farmer produced the hay, silage and corn meal in the ration, he would only use 3.5 pounds daily of purchased grain, costing 4.7 cents, while the bran ration would require a daily cash outlay for grain of 7.25 cents.

The two rations contained almost identical quantities of digestible protein and of total digestible nutrients. rations appeared to be equally well relished by the animals. The entire herd consumed the bran ration without the least irregularity, while on the silage ration the cow May suffered an attack of indigestion which caused her to shrink noticeably in her milk, and rendered it necessary to reduce her feed for some ten days. Whether this disturbance may be attributed to the character of the ration, or to other causes, it is difficult to state with certainty. Cow Doliska, while receiving the silage ration, underwent an attack of mammitis in one quarter of the udder, which decreased her milk yield, and made it necessary to take away temporarily a considerable portion of her grain ration. This cow was producing a large yield of milk during the experiment, but was not in first-class physical condition. It seems probable that her condition rendered her sensitive to the combination of heavy grain, even though it was distributed through the silage.

Silage,		•		104.96	7.31	20.35	65.33	4.55	12.67		

While the results show that in case of the silage ration it required a little less dry matter to produce a definite quantity of milk and butter fat, they also show that in case of both rations practically the same quantity of digestible matter was necessary to produce an equal quantity of milk products.

Food Cost of Milk Products.

CHARACTER OF RATION.	Total Milk.	One Hundred Pounds Milk.	One Quart Milk (Cents).1	One Pound Butter (Cents)	
Wheat bran,	\$77 76	\$1 09	2.45	18.5	
Silage,	75 42	1 06	2.38	17.5	
Percentage increased cost of bran over silage ration.	3.1	2.8	2.9	5.8	

^{1 2.25} pounds is the commercial figure allowed for one quart of milk; the theoretical quantity is 2.15 pounds, the excess of .10 of a pound being allowed for loss in handling,

With hay at \$15 a ton, silage at \$3.50, bran at \$22, corn meal at \$24, cotton-seed meal at \$28 and middlings at \$26, the silage ration produced milk and butter slightly cheaper than did the bran ration. This difference in cost is due partly to the temporary variation in the cost of the several grains, and partly to the slightly more favorable effect of the silage ration.

Approximate Fertilizer Ingredients in Rations (Cost).

Wheat Bran Ration.				
172.29 pounds nitrogen, valued at .			\$30	15
134.92 pounds potash, valued at .			5	40
68.04 pounds phosphoric acid, valued a	t		2	72
Total,			\$38	27
Silage Ration.				
169.99 pounds nitrogen, valued at .			\$29	69
119.77 pounds potash, valued at .			4	79
54.88 pounds phosphoric acid, valued a	ıt		2	20
Total,			\$36	68

The total rations consumed by the herd contained nearly the same quantity of plant food. There was a slight excess of potash and phosphoric acid in the bran ration, due to the richness of the bran in these two mineral constituents.

Conclusions.

- 1. The silage ration produced slightly more milk and milk ingredients at a trifle less cost than did the bran ration.
- 2. A little less dry and digestible matter was required to produce a given quantity of milk products with the former ration.
- 3. Two animals were temporarily out of condition while receiving the silage ration. This may have been partly due to the effects of the heavy concentrates and partly to other causes.

Discussion of Results.

1. In both experiments hay and corn silage served as the roughage, while a mixture of cotton-seed meal, flour middlings and bran, or cotton-seed meal, flour middlings and

corn meal or corn and cob meal, served as the two grain rations; bran acted as a diluter of the heavy concentrates in one case, and corn silage in the other.

- 2. In the first experiment the results were slightly favorable to the bran ration, while in the second experiment the conditions were reversed. The differences were so trifling that it may be said that for practical purposes both rations produced equally satisfactory results.
- 3. As a practical deduction, the writer would suggest that farmers who keep comparatively small herds, and who personally look after the feeding, may reduce the quantity of purchased grain to 3 or 4 pounds daily per head, and substitute home-grown corn in place of wheat bran. Five to 7 pounds of grain daily is the usual allowance for cows producing about 10 quarts of milk of average quality. This grain mixture may consist of 11/2 pounds of cotton-seed meal, 2 pounds of flour middlings and 2½ to 3 pounds of corn or corn and cob meal daily; or 1½ pounds of cottonseed meal, 2 pounds of oat middlings or rye feed and 21/2 to 3 pounds of corn meal. Malt sprouts may be substituted for the wheat, oat or rye middlings. The several grains after being mixed should be distributed through the silage or cut hay with the aid of a fork. This method of feeding will enable the farmer to get along with a minimum cash outlay for grain (4½ cents daily), and at the same time he will be supplying a well-balanced ration, rich in elements of fertility. The method will be more particularly suited to farmers not having easy transportation facilities, and who sell their dairy products to the creamery.
- 4. Farmers and dairymen who cannot closely supervise the feeding, and who desire to feed more than 5 to 7 pounds of grain daily, will probably find it advisable to use one-third to one-half wheat bran in compounding the grain mixture. Distillers' grains and malt sprouts have also been shown to be quite satisfactory distributers of the heavy concentrates.¹

Bulletin No. 94 of this station.

REPORT OF THE BOTANIST.

G. E. STONE; ASSISTANT, N. F. MONAHAN.

The long period of dry weather during the past summer has rendered many plants free from certain types of fungous diseases. On the other hand, the dry conditions were favorable for the outbreak of other troubles. A considerable amount of rain fell, and a more or less prolonged period of cloudy and damp weather prevailed during the latter part of August and first of September, which brought on some severe cases of blight. This rainy and damp period, coming as it did after the severe drought, exerted a peculiar influence on the quality of fruit, and in some instances it was responsible for inducing a renewed activity of the reproductive organs of plants. It is well known that favorable conditions following a check often stimulate vital activity along the lines of reproduction, and it was not surprising to find some wild plants responding in this manner.

DOWNY MILDEW OF TOMATO.

(Phytophthora infestans, DBy.)

The damp and rainy period following the prolonged dry season caused an unusual outbreak on tomato plants, namely, the downy mildew, which is the same as that giving rise to the late blight of potatoes. It is seldom that this mildew attacks tomatoes, in this State at least, to any extent; but this season the damage was quite severe and widely disseminated, especially injuring the younger vegetative portions of the plants.

POTATO ROT.

(Phytophthora infestans, DBy.)

The fungus mentioned above was also responsible to a large extent for damage to potatoes, causing them to rot, especially those grown on moist land. During the early part of the season potatoes as a whole were remarkably free from blight, and not until the rainy and damp period came in September did they display any alarming troubles. In some instances quite a large percentage was destroyed by rot. The spraying of potatoes in this State has not met with that degree of success that it has in other New England States, one reason being that the early blight often occurs here quite disastrously, and obtains a foothold early in the season.

Spraying for this trouble should commence early in June, when the plants are about one-fourth grown, and continue until late in the season. Another factor underlying successful spraying is pressure; at least 50 pounds' pressure should be maintained by the pump, to secure the best results. Experiments at the college this year showed material gain in the quantity of potatoes secured from sprayed crops, as compared with those not sprayed.

CUCUMBER AND MELON BLIGHT.

The dry summer with its freedom from moisture proved favorable for cucumbers and melons, and these crops were not severely affected, at least previous to September, with either the downy mildew or anthracnose. During the past fall there has occurred considerable infection to greenhouse crops, especially those started early. For the last six or seven years the downy mildew (Plasmopara Cubensis (B. & C.) Humphrey) has occurred generally upon greenhouse cucumbers started early in the house, and occasionally the anthracnose (Colletotrichum Lagenarium (Pass.) Ell. & Hals.) appears in the fall, but we know of no instances where either of these blights has wintered in greenhouses. Both of these blights must therefore at present be considered as left over from summer. The anthracnose, however,

usually makes its appearance in the spring on greenhouse plants, and the mildew about the 15th of August on either outdoor or greenhouse crops. Both of these blights can be readily controlled in the greenhouse by judicious attention to cultural methods. Neither of them will survive if attention is given to light, ventilation and especially moisture. When the foliage is kept dry these fungi are unable to get a start. In case syringing is necessary to keep the red spider down, it should be done in the morning in bright sunlight, at which time the plants will dry out readily. In case these blights have attained some headway, the pipes should be painted with sulphur and oil. Beneficial results have been reported by different growers who have tried this method.

SUN SCALD.

The general interest manifested in shade trees in this State is quite apparent from the large number of specimens sent us each year, and the amount of correspondence touching upon various matters concerning them. The number of cases of sun scald to shade trees the past summer was unprecedented. This was particularly noticeable in rock maples and white pines, although this same trouble occurred with many trees and shrubs to some extent. The sun scald on rock maples was unusually abundant, and more severe than Some trees which were under our observation had as much as ninety per cent. of their foliage as dry and crisp Some maple trees possess the peculiarity as casted leaves. of having their leaves badly scorched each year, where other trees of the same species located near them are entirely free from this trouble.

As a result of the prolonged drought and the excessive heat during mid-summer, many rock maples developed foliage of a peculiar bronze color. There was also much premature fall coloring and defoliation on many trees. The cause of so much sun scald during the past summer was drought and dry winds.

Where fine specimens of lawn or roadside trees exist, every effort should be made to maintain them in the best

condition possible. A deep, rich, loamy soil, well supplied with organic matter, constitutes a good guarantee against sun scald.

BURNING OF CONIFERS AND EVERGREENS.

The burning or drying up of leaves commonly seen on conifers and other evergreens in spring is the result of winter or spring injury. Trees affected in this manner show the burning generally on one side, which coincides with the direction of some prevailing wind or storm. This is a genuine scald, similar to that prevailing on other trees, and occurs at a time when the ground is frozen and drying winds prevail. This is usually brought about by a sudden rise of temperature in the early spring when the plants are in frozen ground, at which time transpiration is active. Under these conditions root absorption is limited, whether the soil is moist or dry, and burning results.

An arbor vitæ hedge, which has been under our observation for some years, located on high ground with a severe exposure, becomes burned more or less every year. Frequently the burning is on the southeast side and occasionally on the southwest, but more often on the northwest, which is the direction of the prevailing winds.

There is a considerable amount of burning to conifers and rhododendrons in this State, and not infrequently this is so bad that the specimens are ruined. Much of this injury occurred during the winter of 1904–05, on evergreens located on private estates and in nurseries. One nurseryman states, for example, that all his evergreens, which included various species of abies, buxus, chamæcyparis, juniperus, picea, pseudotsuga, taxus, thuya and tsuga, burned last winter, and other nurserymen have experienced trouble with retinosporas and varieties of thuya or arbor vitæ.

Our native conifers are seldom injured in this manner except when transplanted in some uncongenial place, or where the environment is more or less modified. Swamp cedar burns frequently when taken from the swamp and

grown in ordinary soil, and the arbor vitæ, sparingly found as a native in this State, frequently burns when planted on high or more or less dry land with severe exposure. This holds good also for hemlocks, and to a certain extent for pines and junipers.

WINTER-KILLING.

The disastrous effects of winter-killing are probably more discernible in the State at the present time than for many years; at least, we have no recollection of seeing so much damage done to so large a variety of trees and shrubs as has occurred in the last two or three years. The winter of 1903–04 was extremely severe on most of the native and exotic plants, including trees, shrubs and vines; and, while the winter of 1904–05 was not so severe in many ways, the past summer has done much to emphasize any trouble that was present to a slight degree before. The winter of 1902–03 was also a severe one, although the effects of killing during that period were largely above ground.

The symptoms of winter-killing are tolerably well marked in most instances, especially to the trained observer, and it is seldom that it need be confounded with anything else, neither is it always necessary to make extensive examinations of root systems to ascertain root killing. Furthermore, because a plant is native constitutes no evidence of its ability to withstand unusually severe conditions, since unusual seasonal peculiarities often render them less hardy. For example, the Labrador tea, which is a native of Labrador, has been known to winter-kill in this State, although the climatic conditions of this State are decidedly milder than those of Labrador. There are several classes of winter injury which may readily be distinguished, some of which are not unusual, and can be found every year. There is killing of that portion of the plant above ground as well as killing of the root systems, the latter being extremely common during the winter of 1903-04. Besides these types of injury mentioned above, there frequently occur frost cracks, twig killing, bud injuries, blisters to leaves, etc. The latter has occurred occasionally in leaves of apple trees in the spring when they were tender, and frequently results in almost complete defoliation of apple trees during August. This trouble has been studied by Sorauer in Germany, by Stewart in New York, and by Stone and Smith in this State.

Some of the conditions which underlie winter-killing are as follows:—

Severe cold, causing frost to penetrate to a great depth.

Sudden and severe cold following a prolonged warm spell in the fall, in which case the wood tissue is tender and immature.

Conditions which favor a soft growth and immaturity of wood. Various causes may be responsible for this, such as growth in a low, moist soil, too heavy manuring or fertilization, or absence of sufficient sunlight.

General low vitality, caused by insect pests and fungous diseases and lack of moisture in the soil.

Insufficient soil covering, such as lack of organic matter, light mulching and snow covering in winter.

Location in unusually windy and exposed places, etc.

Species with a limited maximum range for cold are especially susceptible. There are innumerable examples at hand which will furnish illustrations of the various causes of winter-killing. For example, low vitality is well illustrated by the large number of old apple trees which have died in the last two years. The old, neglected orchards were the worst sufferers from the effects of winter-killing, and many isolated trees, such as cherry trees that had received no care for some years, were badly affected.

In one instance a number of peach trees and various kinds of shrubbery, both native and exotic, were severely injured where located near an overflow from a cesspool, while similar shrubbery near by was not injured in the least. This injury was due to the more rapid and tender growth of those plants which received benefit from the cesspool overflow. Perfectly hardy native plants, being deprived of a normal amount of light or grown in too dry places, are winter-killed readily; and Japanese maples on high, dry ground with severe exposure are extremely subject to winter-killing.

By far the most noticeable effects of winter-killing have

occurred above ground. This in some cases has resulted in local injuries to the trunk or in the loss of a few limbs, which has been responsible for completely ruining the symmetry of many valuable specimens, while in other instances many plants have died back to the ground. Some of the plants which have been affected in this way are as follows: Japanese maples, sycamore and Norway maples, apple, peach, plum, cherry, quince, grape vines, Japanese clematis, matrimony vine, roses, Forsythias, California privet, Amorpha fruticosa, Callicarpa purpurea and Americana, Ampelopsis tricuspidata, Deutzia scabra and gracilis, Diervilla florida-candida, Catalpa bungei, Exochorda grandiflora, Hibiscus syriacus, Magnolia tripetala, Lonicera japonicahalliana, Stephanandra flexuosa, Viburnum tomentosum, Tamarix tetrandra, Rhus semialata and Æsculus pavia.

Among the native plants may be mentioned the pine, ash, oak, white birch, alder, spice bush and holly. We observed large clumps of white birch and alders winter-killed above ground. The winter-killing of branches and twigs often occurs on young Japanese maples, especially where exposure is severe or when not given the best cultural conditions; and the young twigs of Norway and sycamore maples and horse-chestnuts have been quite susceptible to winter-killing of late. The killing of the buds and wood occurred in forsythias, peach and roses. Much of this winter-killing of branches, etc., is generally followed by an outbreak of Nectria cinnabarina and Schizophyllum.

As previously stated, the winter of 1903-04 was extremely severe in the amount of root killing which took place. The trees showing injury were the apple, pear, peach, quince, cherry, plum, white pine, red and rock maples, butternut, ash, oak and elm. Among shrubs, vines, etc., were the grape, raspberry and blackberry.

Many of the exotic ornamental plants suffered in the same way, such as, for example, the deutzias, California privet, etc.; in fact, many of the native and exotic species showed killing both above and below ground. The trees which have shown root killing the worst are apples, red maples, butternuts and pines. The effects of the winter-killing of

roots manifest themselves in many ways. Sometimes the plant is killed outright, while in other instances only a slight injury is caused. Many maples, for example, were killed outright, while others lost only a certain per cent. of their roots, thus causing thin tops, and where this injury was not very extensive many of the thin-top trees recovered in one year.

In some instances the leaves at the top of the red maple remained in a half-developed condition throughout the summer. In such cases the leaves were rather pale in color, and they assumed a peculiar pendulent position on the branches. These trees have also for the past two years manifested a premature autumnal coloration, especially on those portions with poorly developed foliage, the result of a limited water supply caused by winter-killing of the roots.

Apple trees were affected to a large extent by root killing, and many hundreds of them have succumbed. In many cases these trees would have been saved if severe pruning had been practised at the time of the first appearance of this trouble, since severe pruning of the tops of the trees would have balanced the root and branch systems. Peach, plum and quince trees were affected in the same way, but the trouble was not nearly so general with these. The same holds true for blackberries, raspberries and grapes. One of the peculiarities displayed by many of these plants consisted in their leaving out and bearing fruit, then suddenly collapsing.

The white pine was the most extensively affected tree. These trees in some localities were so severely affected that many of them died during the spring following the winter of 1903–04. In some severe cases the trunks were frozen and badly injured, but in the greater majority of cases the tips of the new leaves became brown and died. The dry summer of 1905 was severely trying for these partially affected pines. Had a normal water supply been available, this injury would not have resulted. The specimens which we examined had a large percentage of the small, fibrous roots killed, but in no case observed had the large roots been injured. This pine injury extends throughout the

whole State, but appears to be less common in the Connecticut valley than elsewhere.

One of the most distinctive features connected with the pine during the past summer was the burning of the tips of the leaves. In most cases the young, new leaves commenced to turn yellow at their ends, as if sun scorched, but usually grew worse; and in many instances all the needles turned vellow, subsequently died and dropped off. This might not occur on the whole tree, but on only one or more branches. Occasionally this trouble would occur before the young needles reached their normal length; and in such cases the needles would be short and the tree would present a stunted foliage, as we sometimes see on pines grown in very dry soil. Many were inclined to believe that some fungous disease was affecting the pines. Our examinations of the young needles in early summer showed no indications of fungi being present, and others have reported the same Subsequently, however, there appeared various species of fungi on the leaves, and in some cases on the branches, etc. This was merely a natural result following the weakened condition of the tree, caused by the affected root system.

Mrs. Flora W. Patterson of the Department of Agriculture in Washington, who had exceptional opportunities to examine the pine trouble as it occurred in New England and elsewhere during the summer, reports at least six different species of fungi upon the needles and branches. From examination of considerable material gathered in this State she has reported having found Phoma Harknessii, Sacc., Septoria parasitica, Hartig, Hendersonia foliicala, Berk. The Septoria was found in connection with the leaves that had their tips burned, and the Hendersonia was associated with a general yellowing or irregular spotting of the needles, while the Phoma was found with a quite different and by no means common trouble, causing no serious injury to the trees.

In conclusion, we would state that the trouble affecting the pine in this State was due primarily to the extreme winter-killing of the roots during the winter of 1903-04, together with the unusually severe drought occurring in the summer of 1905. The occurrence of so many different fungi on the pine, which especially predominated during the late summer and fall, was very largely a secondary result of the weakened condition of the tree caused by winter-killing.

Relation between Soil Aeration and Germination and Growth.

For some time our attention has been given to the relation existing between seed germination and plant development, and soil texture and aeration. This problem possesses a practical bearing, inasmuch as it underlies the question of soil selection for specific crops. It is not our purpose at present to go extensively into this subject, but only to touch upon one phase of it. It is well known to gardeners and others that aeration, or the presence of air in soils, plays quite an important role in the development of seedlings. This experiment was made to determine what effects forcing air through soil would have upon germination and growth. For this purpose we made use of loam placed in two boxes, 18 by 18 by 18 inches. In each box there was a round funnel, 41/2 inches in diameter, buried under the soil 11/2 inches from the surface. Both funnels were connected with block tin tubes leading outside of the box, one of which was attached for a period of six hours each day to a water blower, and the other remained unconnected. Lettuce seed, which is quite susceptible to aeration, was employed, and 1,500 seeds were placed in each box, and the necessary data pertaining to germination, etc., were noted.

Table showing Results of Aeration on Growth of Lettuce Seedlings. 1,500 Seeds in Each Box.

			Number of Plants		F SEEDLINGS AMS).	Average Gain in Weight
			obtained.	Total.	Average.	(Per Cent.).
Unaerated,			977	83	.0847	_
Aerated,			1,210	152	.1239	46.27

From the preceding table it will be noted that there was considerable more seed germinated in the aerated box than in the unaerated one, as noted by the number of plants obtained; and that the average weight of the seedlings in the aerated exceeded those in the unaerated by 46 per cent. The seeds in the aerated box showed decided acceleration in germination, there being a difference of at least thirty-six hours in favor of the aerated seed. This experiment lasted from October 5 to November 8, and the difference in the size of the plants became more marked each day. In the aerated box the plants were noticeably larger over the funnel, while in the unaerated box the plants were largest near the edges of the box, where the soil had shrunk away from the sides, which enabled the roots of the seedlings to have free access to air.

That oxygen plays an important part in the germination of lettuce seed is quite evident from many experiments we have made with this species. The mere fact of covering lettuce seed loosely or sifting fine loam on them results frequently in enormous differences in the germination. Such seeds as lettuce and white clover are particularly susceptible to aeration; and, according to our numerous experiments, these seeds germinate best in soils of loose texture.

Comparison of Sterilized Loam and Subsoil.

Some experiments were conducted two years ago by Mr. S. R. Parker, then a senior specialist in the agricultural department of the college, which necessitated using a sterilized soil. In all of Mr. Parker's cultures, which were made in a soil very poor in organic matter, there was an extremely poor and sickly growth of soy bean in those pots which had been sterilized, whereas the growth was good in pots which had not been steamed. The experiments were carried on in our greenhouse, and the results were so different from those occurring in sterilized loam that it was considered wise to repeat them.

A soil similar to this had previously been sterilized for the growth of tobacco seedlings, without producing similar disastrous effects upon the plants. In the single experiment given here we made use of a similar soil, namely, a yellow subsoil loam, containing little organic matter. Eight pots were selected, four of which contained loam and four subsoil. Of these, two each of the loam and subsoil pots were sterilized, and two each of the remaining pots were left unsterilized. The results follow.

Table showing Growth of Soy Bean in Sterilized and Unsterilized Loam and Subsoil.

				Total Number	AVERAGE LEN STEMS		Gain (+) or Loss (-) in
				of Pots used.	Unsterilized Soil.	Sterilized Soil.	Sterilized Soil (Per Cent.).
Loam,				4	9.53	10.87	+14.05
Subsoil,	٠.			4	9.79	4.14	- 57.70

The number of seeds germinated in unsterilized loam and soil was 30, that for the sterilized 34, showing a slight gain in favor of sterilization, which is unimportant, considering the small number of seeds used. There is also a gain in height of loam plants of 14 per cent. in favor of sterilization, while in the subsoil series there is a loss of 57 per cent. due to treatment. The subsoil pots also showed a poor, sickly development. This corresponded in every way with the results obtained by Mr. Parker in his experiments. This experiments shows, among other things, that extreme precaution is necessary in drawing deductions from experiments in which the soil is sterilized, especially where inoculation work is undertaken in connection with soil organisms.

INFLUENCE OF SOIL STERILIZATION ON SEED GERMINATION.

In a previous report ¹ the results of a similar series of experiments were described, and this paper is a continuation of the earlier one. As in the preceding series, the seeds selected were in most cases from an old lot, which possessed a rather low germinating capacity. The object of these experiments was to ascertain the degree of acceleration in germination which would result from plant seed in steril-

¹ Fifteenth annual report of the Hatch Experiment Station, p. 41, 1903.

ized soil. Results of a similar nature have been observed by us a number of times in an incidental way when utilizing sterilized soils in our general experimental work in the greenhouse. The seeds were planted in boxes 18 by 12 by 3 inches, and previous to planting the soil in the sterilized boxes was heated by steam to a temperature of about 212° F. for one hour. The soil used constituted a good typical loam, characteristic of this region, and the sterilized and unsterilized soils were identical in every way except as to Other conditions, such as heat, light, degree of moisture, etc., were made the same as far as practicable. In Nos. 15 to 23, inclusive, 600 seeds were used in three separate experiments, where 100 seeds were sown in sterilized soil and 100 in unsterilized soil. In Nos. 25 to 34, inclusive, 800 seeds each were employed, there being two experiments. No. 39 is the result of only one experi-

ment, this being made in the greenhouse bench soil; 500 seeds were sown in unsterilized soil and 500 in sterilized soil.

The data given in the table show that there occurred a positive gain in germination of the seed sown in sterilized soil. Nos. 20, 29 and 33, however, were old seed, which had apparently lost their power of germinating, and the stimulating effect induced by soil sterilization evidently had no effect on them. There is no reason for believing that when seeds have once lost their germinating power, or, in other words, are dead, this process will revive them. percentage gained in some instances is quite marked, while in others it is insignificant. The average obtained from this series is 21 per cent. On account of the low germinating capacity prevailing here in many instances, the percentage gained is only indicative, since it would be necessary to employ a larger number of seeds to obtain more accurate averages. It should be pointed out, however, that better results than those given in these experiments have been observed many times in connection with lettuce, cucumber, melon seed, etc., in the greenhouse, where seed was used on a much larger scale. The degree of acceleration in germination is also marked, a feature which has been frequently noticed by us before. The number of seeds germinated during the first few days of these experiments, including Nos. 15 to 34, inclusive, was 169 for the sterilized soil and 146 for the normal loam, or a gain of 14 per cent. in favor of the sterilized soil. In the former series of experiments, previously noted, we obtained 25 per cent. of acceleration at the end of four days. There undoubtedly exists a difference in seeds in their response to stimulation in sterilized Tomatoes, for example, respond but little if any to this method of treatment. The cause of this variation in different species of seeds is not known. Experiments are now being made along different lines which may throw some light on this question. The benefit to be derived from sowing seed in sterilized soil, both from a physiological and pathological point of view, is important enough to warrant in many instances its practice.

INFLUENCE OF SOIL DECOCTIONS ON SEED GERMINATION.

Some attempt has been made in the following experiments to ascertain the cause underlying the effects which sterilized soil has on seed germination. The question has often arisen, In what manner does soil sterilizing affect seed germination? Is the cause underlying this form of stimulation a mechanical one. or a chemical one? In all probability both mechanical and chemical factors play a role here. If, however, the stimulus is of a chemical nature (and such types of stimulation are common enough to seeds), we would expect some response to occur on the part of the seeds when treated with decoctions of sterilized soils. For special reasons we therefore selected two types of soils, one of which was a typical Amherst loam, fairly rich in organic matter and suitable for greenhouse culture; the other soil a vellow loam of the nature of an Amherst subsoil, deficient in nitrogen and containing only a slight amount of organic matter. of experiments were carried out with each soil. In each set there was a boiled loam and subsoil, a sterilized loam and subsoil, and a normal loam and subsoil. The boiling and sterilizing lasted fifteen minutes, the latter being mostly done in an autoclave, under fifteen pounds pressure and at a temperature of 250° F. In all cases 400 grams of soil were The soils were placed in percolators, with 500 c.c. of distilled water, and allowed to stand for twelve hours and to percolate very slowly. Four hundred grams of normal loam and subsoil, that is, soil that is not treated, were percolated in the same manner as the others. In addition to the above tests, tap water cultures were employed as checks, and run parallel in every way to the others.

In some instances, however, distilled water was used, besides the tap water, but since no difference existed between them, the distilled water tests were discontinued. After a percolate had been obtained for the various soils, the seeds were soaked in them for six hours, and then placed in germinators of the Zurich type, or into germinators composed of flower pot saucers provided with filter paper. In one or two instances the soy bean was germinated in sawdust.

Table I.— Showing the Influence of Soil Decoctions upon Germination of Seeds immersed for Six Hours in Decoctions made by percolating 500 c.c. of Water through 400 Grams of Soil; 800 Seeds used in Each Treatment, except with the Soy Bean, where only 700 were used, making a Total of 21,700 Seeds.

The preceding table shows the results obtained from experiments in which 21,700 seeds were employed. Since a large number of seeds were used in these experiments, quite accurate averages were obtained, and the factors due to variation are eliminated to a large extent. There is apparently a slight gain due to treatment shown in these experiments. The best average results were given by the boiled subsoil and loam, followed by the normal, while the sterilized loam is below the tap water seeds. By noting carefully the results obtained in these experiments, together with the nature and color of the decoctions, we surmised that the decoctions were too strong for the best results, consequently they were diluted with water to one-half strength in the next experiment.

Table II. — Showing the Influence of Soil Decoctions upon Germination of Seeds immersed for Six Hours in Decoctions made by percolating 500 c.c. of Water through 400 Grams of Soil, diluted to Half Strength; 600 Seeds used in Each Treatment, making a Total of 16,800 Seeds.

			Percentag	e of Gerb	MINATION I	N

Total average,		66.7	74.6		83.4		79.4				

The experiment with one-eighth strength decoction shows a decided gain throughout in the treated seeds, the most marked being given by the boiled and sterilized loams and subsoil decoctions. No further dilutions were tried, but from a careful study of the results of these experiments we are inclined to the belief that if more dilute solutions were used an increased gain would occur, especially in the sterilized series, since the most highly colored decoctions were obtained from the sterilized soils and the next highest color from the boiled soils. It appears to us that the sterilized decoctions were too strong, even when diluted to one-eighth strength. Some variation in the strength of the decoctions is likely to occur as a result of different percolators, and the failure of the one-fourth and one-half strength to show more of an acceleration may be attributed to this cause.

The following table gives the number of seeds that germinated in the first twenty-four hours in the preceding experiments, including tables I., II., III. and IV., from which the degrees of acceleration and retardation due to treatment can be obtained.

Table V.— Showing the Degree of Retardation and Acceleration in Germination of Seeds soaked for Six Hours in Decoctions of Different Strengths made by diluting 500 c.c. of Water which had percolated through 400 Grams of Soil treated as below.

This table gives the results of germination during the first twenty-four hours of 42,000 seeds, and the degree of acceleration obtained corresponds in a general way with the total number germinated as given in the preceding tables; or, in other words, the relationship between acceleration and the total number of seeds germinated is similar. Comparing the average number of seeds germinated during the first twenty-four hours by the various treatments with tap water, there are no important differences shown. On the whole,

however, there is a gain or acceleration due to treatment, the maximum acceleration being shown by the boiled loam.

A comparison of the different strengths of solutions shows that the one-eighth dilution produced the best results of any of the treatments, that for boiled loam being the highest. This series of experiments shows that decoctions of soils variously treated induce acceleration in seed germination, and that a larger number of seeds germinated in decoctions than in tap water. This increase is quite marked in dilute decoctions (one-eighth strength), and would probably be increased to some extent if the dilution should be carried still further. In these experiments we have a chemical explanation for the cause underlying acceleration and increased germinating capacity in sterilized soils. Undoubtedly driving out the gases and the subsequent absorption and renewal of fresh oxygen in sterilizing practices acts beneficially to soil and induces the seeds to germinate more quickly, as is shown by the aerating experiments previously reported. By the process of aeration, or by soaking seeds in dilute decoctions, many seeds germinate that otherwise would not; but there is no ground for belief that any of these stimulating processes actually revive or rejuvenate worthless seeds to a greater extent than would result from the most favorable conditions for germination.

Sterilized subsoil, or that lacking in humus, has the same effect on germination as sterilized loam rich in organic matter; but it inhibits growth to a very large extent, thereby differing in this respect. It would appear, therefore, that a considerable amount of humus is necessary in soils, in order that they may be materially benefited by sterilization.

The reason that bacteria multiply more and plants grow much more luxuriantly in sterilized soils is undoubtedly due to the fact that a larger amount of available material for plant development is present. Why subsoils and those poor in organic matter give rise to a greatly inhibited growth is not so clear at present, and we are not prepared to offer any explanation of this phenomenon.

SEED SELECTION.

It is a well-known fact that heavy, well-developed seeds produce more vigorous and more productive plants than lighter seeds of the same variety. This is altogether a reasonable statement, because the heavy, well-filled seed has the more perfect embryo, and also has the larger supply of plant food on which to support the seedling until the plant is capable of getting its nourishment from the air and soil.

With such crops as wheat, rve and the grasses, the selection of seed is not of so very great importance, because usually an overabundance of seeds is planted, and sufficient seeds develop so that in the natural struggle for existence in their overcrowded state the weaker and less vigorous plants are crowded out and only the more vigorous and healthy plants reach maturity; and this number which reaches maturity represents the maximum number of plants that can be developed under existing conditions, so that nothing in the crop is lost by this crowding out of the weaker plants. On the other hand, with greenhouse, market gardening and general field or what is known as hoed crops, the conditions are entirely different. In this case each plant has its full share of light, heat and space, and a poor, weakly plant is just so much loss, not only because it occupies a space that ought to produce a well-developed plant, but also because a number of undersized, weakly plants in a crop detracts from the market value of the crop as a whole, and also because weak plants are more subject to disease, and act as a breeding-place for diseases that may infect the whole crop; therefore, the careful selection of seed becomes an important factor in growing plants. In the case of large seeds, such as corn, this selection is comparatively an easy matter. corn of the desired type, having kernels of a desirable size and shape and of full development, may be picked out, and by discarding the poor, undeveloped seeds at either end the rest of the seeds may be utilized for planting. Here knowledge of the type of seed and judgment only may be relied Beans, peas, etc., may be selected in much the same way, with reasonable assurance that the best results will be

obtained. In the case of such seeds as lettuce, turnip, cabbage, tobacco and other small seeds this method of separation is not practicable, and other methods have to be resorted to.

From early times the separation of seeds by means of water has been practised to a considerable extent. In this case the seed is placed in a quantity of water, well shaken and let stand a few minutes, then the seeds which do not sink are removed, and only those that have sunk used for planting.

The results of some of our experiments with this method of separation are given in the tables following.

Heavy (sank), .	.	42.5	85	18.1	.213	37.42
Light (floated), .		19.5	38	5.9	.155	_

This method, however, is not entirely satisfactory, because many of the heavier seeds are buoyed up by air bubbles and therefore thrown away, and in our work we have noticed that a few of the undersized seeds also go to the bottom.

Many investigators 1 have carried this process still farther, and separated their seeds by what is known as the specific gravity method. In this case solutions of salt (sodium chloride), ammonium nitrate, sodium nitrate, potassium nitrate and calcium chloride have been used. For this purpose solutions of different specific gravities have been made, in which the seeds were placed, first in that solution with the highest specific gravity. The seeds which floated in this solution were skimmed off and placed in that of the next highest specific gravity, and so on. It has been found that by this method seeds of the same variety, of a uniform, sound condition, differ in specific gravities only within a very narrow range. This, however, does not seem to be a very practical plan, as it involves the making of solutions of tested specific gravity and quite a little mechanical manipulation. Another method, known as the specific gravity sampling method, is perhaps of less value, as in this case one lot of seed is compared with others in bulk, without separating the poor and undeveloped seeds. It amounts simply to the choosing of the best lot from several samples of seeds.

The separation of seeds by sieves would seem to be the easiest and most practical way, and this method with us has given very good results. We used a series of four sieves, having round perforations of 2 mm., 1.5 mm., 1 mm., and .05 mm. respectively. Ten grams of seed were weighed out and run through this series of sieves, with the following results:—

Table III. — Showing the Results of sifting Seeds, in which 10 Grams were employed.

	Nu	MBER	OF S	Sieve			Size of Seed.	Weight in 10 Grams of Seed (Grams).	Per Cent.
No. 1,					,		2.0-1.5 mm.	1.015	10.15
io. 2,							1.5-1.0 mm.	6.689	66.88
No. 3,							1.05 mm.	1.800	18.00
So. 4,							.50 mm.	0.491	4.91

¹ Among whom may be noted V. A. Clarke, New York (Geneva) Experiment Station, Bulletin No. 256.

Five hundred seeds were then counted out from each of these four grades or sizes of seeds, with the exception of No. 4 (.5-.0 mm.), which was composed entirely of chaff, dirt, etc. These were sown in flats and allowed to grow for four weeks, when the seedlings were taken up, counted and weighed, with the following results:—

Table IV. — Showing the Results of Germination and Growth of Seedlings from Three Experiments with Sifted Lettuce Seed; 1,500 Seeds used in Each Experiment, making a Total of 4,500 Seeds employed.

SIZE OF SEED.	Per Cent.	Number of		SEEDLINGS AMS).	Average Per Cent. gained in Weight of Large
SIZE OF SEED.	germinated.	Seedlings.	Total.	Average.	over Small Seedlings.
2.0–1.5 mm.,	56.7	672	347.5	.518	98.42
1.5-1.0 mm.,	53.5	642	293.7	.457	75.09
1.05 mm.,	40.4	485	126.3	.261	-

From this table it will be seen that of the large 16.3 per cent. and of the medium 13.1 per cent. more seeds germinated than of the small seeds, and that the four-weeks-old seedlings from the large seed averaged 98.42 per cent. and those from the medium seed 75.09 per cent. heavier than those from the small seed. It will also be noticed that the differences in the per cent. of germination and the weight of seedlings from the large and medium seeds were not very great; but the difference between the germination, and especially in the weight of seedlings of the larger and small seeds, is very marked.

We are of the opinion that it would pay a grower to separate his lettuce seed with a sieve having a mesh of one millimeter in diameter (½5 inches), and to use only such seed as did not pass through a sieve of this size. From these plants he could make a further selection, as is customary at the time of transplanting. This would result in saving considerable ground space which is valuable, and not only would a more vigorous and uniform setting of lettuce be obtained, but the treatment would also eliminate many weak and undesirable plants, which are more likely to be sus-

ceptible to disease. In other words, much of the selection would be done more cheaply and easily by sifting the seed than as it is done at the present time, by selection in the seed bed. A sieve of the size mentioned can easily be made by purchasing from almost any tin shop a piece of colander tin of 1 millimeter mesh, which can very readily be soldered to a suitable rim, or even fastened to a tomato can which has had the bottom removed.

Our experiments in sifting seed have been confined, however, for the most part to lettuce seed; and, while these seeds can be separated in this way very easily, much more difficulty would be experienced in separating some other types of seed, such as turnip or tobacco; and another objection to this method is that the size and weight of seeds do not necessarily correspond, that is to say, a large seed may not necessarily be a heavy one. When seeds are separated by sifting, while the largest size contains practically all of the heaviest seeds and the lighter seed is practically all in the small sizes, there will be a few light seeds in the larger size and a few heavy seeds in the smaller sizes, so that this method by no means gives an absolute division of the seeds by weight, which is the ideal method of seed selection.

Mr. A. D. Shamel of the Connecticut (New Haven) Experiment Station uses a very satisfactory method for the separation of tobacco seed, which we can do no better than describe in his own words:—

This seed separator consists of a glass tube 1 inch in diameter and 5 feet long, and a glass receptacle for holding the seeds, having the diameter of the long glass tube, and so arranged with a finely woven wire screen in the bottom as to hold the seeds in the receptacle, and at the same time freely admit a current of air directly into the seed. The top of this receptacle is fitted with a coupling into which the long glass tube can be set and held in place. The current of air is developed by a common foot bellows and regulated with a valve. The seed to be separated is poured into the receptacle, usually about 1 to 2 ounces at a time, the glass tube set in place and a current of air pumped into the seed. The lightest seed and chaff are first blown out of the tube, and next the small seed. Small

seed of the same character as the larger seed have proportionally more surface than the larger, consequently the small as well as the light seed is removed by this machine.

This seems to be the most satisfactory way of separating seed that has yet been devised, and no doubt some simple, inexpensive instrument modelled from this device will soon be available for every farmer and seed grower. The particular advantages of this method seem to be that this device is adaptable to all kinds of small seeds, the only adjustment needed being in the regulation of the amount or force of air sent through, and that by this method the seed is separated according to weight.

In conclusion, we believe it desirable with many kinds of garden seeds to separate the seed and discard all except the large, well-developed, mature and heavy seed, because:—

First. — About 33 per cent. of seeds as placed on the market consist of dirt, chaff, and small, undesirable seeds.

Second.—Small or light seeds do not germinate well, and their seeds produce only poor, small, undesirable plants, which prove inferior in every way.

Third. — Heavy seeds produce healthy, large, well-developed plants, that will give maximum crops.

Fourth. — Seed selection or separation is an inexpensive process that gives good results.

Asparagus Rust.

The past summer in most parts of Massachusetts has been an extremely dry one, and especially favorable, as was early anticipated, to an early and severe attack of asparagus rust. The confinement of the rust, or at least its injurious stage, to special localities has been the same this season as in other years; in other words, it has been confined to soils especially coarse, and easily affected by drought.

Since 1896 there have been about three severe outbreaks of the rust in this State, such outbreaks being identified with a dry summer, or at least with seasons where there have existed long periods between rainfalls. The fall or teleuto stage, however, has been present every year since

1896, and it has always been widely distributed. Any bed which has become once infected with this stage remains so, but fortunately the damage occurring from teleutospore infection is insignificant, and in the majority of cases not discernible. Asparagus rust has now become quite well distributed over the United States, but its virulence does not show itself in the same degree for every locality, and the problem of control is by no means everywhere the same, since factors enter into the problem which do not possess the same significance for all locations. In this State rust is most intimately associated with lack of vigor, and more particularly with those factors which underlie vigor, such as supply of water and judicious fertilizing. For this reason the most efficient remedies are based upon those practices the application of which induce vigor. There are a number of remedies which can be applied, some of which have given Thorough cultivation and fertilization excellent results. in more than one instance have given results which have proved superior to any other method of treatment. We have observed that the results from weekly cultivation combined with judicious fertilization have proved very satisfactory. Irrigation has also proved very effectual during dry seasons; but there is possibly a tendency for asparagus to become too succulent with repeated irrigation, which might possibly render the plant more susceptible to infection.

We also believe that an efficient practice pertaining to rust infection consists of burning the old brush in the fall, since a large number of teleutospores are destroyed, which, if left remaining in the ground over winter, would germinate freely in the spring and constitute a dangerous source of infection. We have repeatedly attempted to germinate teleutospores in the early winter, but failed. They will germinate freely in March, however. Moreover, the roots from infested plants, when transplanted in the greenhouse in the fall and left there for a year and allowed to develop tops, have never shown any tendency to rust. This would seem to indicate that not only is a resting period essential, as is usually the case for spores, but freezing also is essential. We are of the opinion that most beds are infected in

1906.7

this State by teleutospores during the spring and summer, and that the mycelium works up through the stem; and if the conditions for the plant are unfavorable, pustules bearing uredospores will break out in July or August, whereas, if the conditions for the plant are favorable, pustules bearing teleutospores will make their appearance during September or later.

In case uredospores break out in the plant during July and August, other beds in the vicinity, if in suitable condition, will invariably become infected. If, however, the crop is in a vigorous condition, even if located close by, it will resist the outbreak of the rust. This, indeed, has occurred many times in beds side by side, although of different age and vigor, and in the case of those beds more or less remote it may be stated that there are hundreds which have never had any uredo outbreak.

We observed a young bed of asparagus the past summer, about two years old, which had never been cut, and which had a teleutospore outbreak early in July. This bed suffered much from drought, and was not in an especially vigorous condition. It was, however, located on soil of fine texture, intermingled with coarse pebbles. little inclination for the plants of this bed to grow worse, notwithstanding the fact that drought prevailed, and it remained in practically the same condition all summer. On dry soil this never occurs, since it is the uredo stage that makes its appearance in these soils in July and August; and plants infected with this stage turn brown in a short time after they become infected. Moreover, the teleutospore outbreak occurring in summer is a perfectly harmless factor, as far as immediate infecting of the bed is concerned. Our studies of the rust problem have shown that there is an intimate connection existing between the texture and water contents of soils and uredospore outbreaks, and a series of water determinations of different soils during the season would probably bring out some interesting facts.

Spraying with Bordeaux mixture has not proved satisfactory in this State as a means of controlling the rust, and little or no use is now made of it for this purpose.

Some reports have been made concerning the use of the

sulphur wash spray recommended by Prof. R. E. Smith, formerly of this station. This mixture, which consists of sulphur, soap, potash and water, possesses remarkable sticking qualities, and it is undoubtedly the most efficient mixture recommended for spraying for asparagus rust.

An Application of the Copper Sulfate Treatment.

Early in the summer the college pond became so overrun with Algæ as to be unsightly, and the smell of this decaying vegetable matter was so unpleasant that it became necessary to treat it.

Microscopic examinations of the water showed that it contained a considerable amount of short suspended filaments, of a slightly whitish or greenish color, which proved to be Anabana flos-aquae, a form of Algae found frequently in public water supplies, and which gives rise to consider-The water content of the pond was roughly determined, and then treated with 1 part of copper sulfate to 4,000,000 parts of water. The required amount of copper sulfate was placed in a loosely woven sack and hung over the stern of a canoe, which was paddled around the pond in concentric circles for about one-half an hour, when all the copper sulfate was dissolved. This is the method recommended by Drs. Moore and Kellerman in their work on treating reservoirs with copper sulfate. A careful examination of samples taken twenty-four hours after treatment showed a slight decrease in Anabana, and in two or three days it had practically disappeared.

Spirogyra, which was present along the shores near the inlet at the time of treatment, was not affected, and subsequently a number of large clumps were found in a flourishing condition in different parts of the pond, and many forms of Algæ, such as Desmids and Diatams, appeared not to be in the least affected by the treatment. Neither did the animal life seem to be affected in any way by the treatment, as no ill effects could be noted on the fish, frogs, tadpoles or other fauna inhabiting the water.

Of the *Protozoa*, the *Ceratium* was very numerous both before and after treatment, and was in no wise affected by

the copper. Daphna, a form of Crustacea, was also plentiful, and experienced no ill effects from the copper treatment.

From day to day the bacterial contents of the water were determined, with the results shown in the following table:—

Copper Sulfate Test on Massachusetts Agricultural College Pond Water.

			D	ATE	OF T	AKIN	s Sa	MPLE	•					Number of Bacteria per Cubic Centimeter of Water.
June 17	(one	hou	r afte	er tr		905. ent)								6,224
June 19,														3,463
June 20,	•					٠		٠			٠			219
June 21,	۰		•		٠			٠		٠			٠	336
June 22,	٠			٠					٠			•		1,583
June 23,					٠						٠	٠		1,187
June 24,	٠				٠	٠				٠	٠			538
June 25,								٠						1,144
June 26,										٠				1,399
June 27,			•											1,144
June 28,						•								616
June 29,														763
June 30,														1,145
July 1,														1,078
July 3,														1,078
Sept. 16,							2							990
Sept. 17,			•,											1,017
Sept. 18,														990
Sept. 19,														636

From this table it will be seen that the bacteria decreased very rapidly for the first few days after treatment, and, while they slowly increased again, they never reached their former numbers. The results obtained on June 24, 28 and 29 may be attributed to an unusually clear or settled state of the water on those days, while when the other samples were taken the water was considerably agitated, either from the effects of rain or wind.

A second treatment was contemplated in September for the

purpose of studying the effects of copper sulfate on bacteria; but as the bacteria showed no appreciable increase at this time, we thought it not worth while to inaugurate another experiment. Samples of water taken one hour and twenty-four hours after treatment were tested for copper by the foods and feeding department of the station; and, while possible traces of the copper were found, they were so small and uncertain that no copper could be reported. In these tests the ferrocyanide method was employed, which in numerous other cases has failed to give reliable results where such small quantities of copper are present.

At the time these chemical tests were being made for copper there came to our notice a test described and recommended by Dr. Ewerts,¹ which claimed to detect one part of copper in 30,000,000 parts of water. This test is based on the inhibiting action of copper to diastatic action. This method was given a trial in the foods and feeding chemical laboratory, and found to be unsatisfactory. Quite likely, however, a detailed study of this latter method, together with some practice, will prove it to be of some value.

The result of this single experiment with copper sulfate in treating the college reservoir is not sufficient in itself to allow deductions of great value. They corroborate, however, the experiments made by Messrs. Moore and Kellerman on the Belchertown reservoir, and those made elsewhere, in showing that Anabana is extremely susceptible to copper, and can readily be killed by this method of treatment. Moreover, the general clearing up and rapid disappearance of odor from the water two or three days after treatment, together with the falling off of bacteria, was quite noticeable. It should be stated, however, that there was a fall of about 20° in the temperature on the third day after treatment, which would have a tendency to affect Anabana; and about one and one-half inches of rain fell between the 19th and 24th of June.

¹ Ztschr. Pflanzenkrank, Bd. XIV., 3 Heft., p. 133.

A Comparison of the Numbers of Bacteria in Sterilized and Unsterilized Soils.

BY A. VINCENT OSMUN.

There has been repeated inquiry as to the effect sterilization of soil has upon its bacterial flora. In the absence of any reliable experiments touching upon this question, it has frequently been assumed that by soil sterilization the bacteria, and especially the beneficial ones, are destroyed, hence injuring the soil. In regard to this question, it may be stated that little is known about either the so-called beneficial or injurious bacteria of greenhouse soils; and, in consequence of a paucity of knowledge upon this phase of the subject, positive statements are out of place. From what is already known about the effects of soil sterilization upon plant growth and the changes which such soil undergoes, it might be assumed upon a priori grounds that soil bacteria would be found to exist more abundantly in sterilized soil than in unsterilized soil. Moreover, it must be borne in mind that absolute sterilization is never accomplished, but something more closely approaching pasteurization takes place. All bacteria are by no means killed, as has been shown by various tests made at this station. Subjecting soils to steam heat has a marked stimulating effect on the growth of plants. Observations at this station and experience of growers have shown this to be true. Just why this treatment of soil should stimulate the growth of plants is not known. Sorauer 2 suggests that steam heat makes the humus compounds more available to plants. It is not unlikely that steam flowing through a soil also improves its mechanical condition.

The stimulating effect of soil sterilization on plant growth suggested a similar effect on the bacterical content of soil so treated; and in order to obtain more evidence regarding this point this experiment was planned:—

Two boxes about 20 inches square and 9 inches deep and of equal weights were filled to the depth of about 5 inches

¹ Hatch Experiment Station, Massachusetts Report, 1902, pp. 77, 78.

² Sorauer, The Physiology of Plants, pp. 45, 46.

with equal amounts by weight of soil from the supply bin of the station greenhouse. Before filling the boxes a quantity of soil from the bin was thoroughly mixed, and the boxes filled from that, so that the soils in the two boxes were as nearly alike as possible. The soil in one box was treated for half an hour with flowing steam applied through perforated tubes buried beneath the surface: the soil in the One week after sterilization a other box was untreated. sample was taken from each box for the determination of the numbers of bacteria in the soil, after which the boxes were placed on a platform scale and brought to equal weights with water. Water was similarly applied every day during the experiment, and the soil always contained from 17 to 20 per cent. moisture. Samples for the determination of the quantitative bacterial content of these soils were taken at inter-The soil was frequently stirred, vals of about two weeks. and at the times of sampling the entire contents of each box were thoroughly mixed and pulverized.

The results of this experiment are tabulated in the accompanying table:—

Showing the Relative Number of Bacteria in Sterilized and Unsterilized Loam.

	D	ATE (of T	AKING	SAN	APLE.				eteria per Gram Ly Soil.
									Sterilized.	Unsterilized
			1	905.						
April 3,	٠					٠			6,742,000	56,273,000
April 18,									64,596,000	39,080,000
May 1,									66,089,000	31,372,000
May 16,							٠.		29,963,000	8,029,000
June 1,									26,666,000	14,634,000

The figures in this table show that steam flowing through soil for half an hour not only does not kill all the bacteria in that soil, but that it seems to act as a stimulus, causing rapid mutiplication of numbers. Practically all vegetative forms would be killed, but most spores would be uninjured, and, given favorable conditions after treating, would germinate. One week after sterilization the treated soil contained

nearly 7,000,000 bacteria per gram. This number is probably considerably in excess of the number in the same soil immediately after sterilization, but it indicates that treating soil with live steam at about 210° F. for half an hour does not kill all the bacteria in that soil. The untreated soil contained a good number of bacteria at the beginning, — about 56,000,000.

During the four weeks immediately after the first samples were taken there was a phenomenal increase in the number of bacteria in the sterilized soil. From 7,000,000 per gram at the beginning the number had advanced to nearly 65,000,000 at the end of two weeks, and after four weeks to over 66,000,000. On the other hand, the number in the untreated soil showed a steady decrease, for which no cause is at present apparent.

After six weeks the numbers of bacteria in both sterilized and unsterilized soils had dropped way below the numbers found at the end of four weeks. During the next two weeks the sterilized soil continued to drop off, though not to any great extent, while the unsterilized soil advanced.

At this point it became necessary to discontinue the taking of samples because of the press of other work.

We are unable to account for the decrease in numbers of bacteria in either sterilized or unsterilized soil. A similar decrease in numbers of bacteria has been noted in other experiments in the greenhouse in which unsterilized soil was used. The temporary increase in numbers in the sterilized soil may be attributed to the stimulus given by the steam heat; and it appears also that sterilization had a tendency to overcome, for a time at least, the antagonistic agency or agencies which caused the decrease in the unsterilized soil.

More extended experiments and observations are necessary before definite conclusions can be reached regarding the effect of so-called sterilization on the bacterial contents of soils; but from the results obtained in this experiment and from tests of other soils, both sterilized and unsterilized, we may conclude that steam treatment of soils greatly stimulates bacterial development in them, and that if certain as yet unknown adverse conditions can be removed, the high numbers may be retained indefinitely.

REPORT OF THE ENTOMOLOGISTS.

C. H. FERNALD, H. T. FERNALD.

The year 1905 has been marked by a great abundance of insects of many kinds, while the two years preceding were equally marked by their scarcity. To this fact is probably due the large increase in the amount of correspondence the present year, nearly two thousand letters having been sent out, besides an unrecorded amount of printed matter, in answer to questions received.

Investigations as to the number of broods and times of appearance of the codling moth and oyster-shell scale have been continued during the season, and should be repeated for several years to come, that reliable date averages may be obtained, and thus the best times for the treatment of these insects be ascertained.

Several private insecticides have been more or less tested and the results noted, statements of these having been supplied in each case to the persons sending the materials. While some of these substances were shown to have a certain value for the destruction of insects, it was noticeable that they were no more effective than well-known insecticides costing less, or that they were injurious to the foliage of the plants they were tested on. In fact, none of the materials tested at this station during the year can be considered as adding anything of value to our present list of standard insecticides, though it has taken considerable time from other work to establish these negative results.

The collections of the division have, as usual, been given the needed care and have been added quite considerably to during the year, while additional facts as to the distribution of insect pests in Massachusetts and their habits have been gathered and recorded. The card catalogue has been kept abreast of the new publications and improved in many ways, and requests for the information it contains are frequently received from other stations and from individuals.

Some study has been given to the carnation twitter, and the identity of the insect causing this trouble has been ascertained with considerable though not absolute certainty. Further investigations on this subject will be made during the coming year if material to study can be obtained.

Special researches have also been continued on the Asilidæ or robber flies; the Pyralidæ, a group including many very injurious insects; the Bombinæ or bumble bees and their habits; and on the Sphecidæ or digger wasps, these studies being of the entire groups; while a Cecidomyiid on oak, the stalk borer and several other species have received special attention individually.

The erection of a new greenhouse during the summer has greatly improved the facilities of the division for entomological research, besides being an excellent example of modern greenhouse construction. With a house which is reasonably tight and which can be kept warm during the winter it has been possible to begin a series of experiments to determine the resistant power of various forcing crops to fumigation. The business of raising crops under glass in Massachusetts is a very large one, and in too many places is greatly interfered with by the presence of insects which can only be controlled by fumigation with hydrocyanic acid gas. The strength of fumigation necessary to destroy these insects is now well known in most cases, but the charge which the plants can resist under all conditions of growth is not; and many an owner has refused to fumigate a badly infested house for fear of killing his plants along with the insects. From the experiments now under way, and which it will require several years to complete, it is believed that data can be obtained of such a nature that any person who desires to treat a greenhouse will be able to do so with entire safety to the plants, and yet kill the insects which may be present.

INSECTS OF THE YEAR.

The present year has been favorable for the rapid increase of insects in Massachusetts, and, though no one species has been present in overwhelming abundance, each has done its part in attacking crops of all kinds.

The San José scale is as abundant as it has ever been in the State, and is spreading farther each year. Where its presence is neglected it makes itself speedily felt; but with the methods we now have for its control there is no reason why it should be more than a nuisance in the future, requiring treatment every two or three years, like any of our other pests.

Cutworms and wire worms have given much trouble, particularly in the eastern and central portions of the State, while but little has been heard of root maggots this season.

The army worm has caused considerable injury locally on some of the cranberry bogs and elsewhere in southeastern Massachusetts, and in the central and western parts of the State the moths of this pest have been more abundant than for some time. It has now been nearly ten years since the last outbreak of this insect, and it is not unlikely that another may be due before long, if unknown factors do not develop to prevent it.

Inquiries about insects have covered a wider range than usual, but the most numerous questions have been about several species of scale insects, plant lice of different kinds, red spiders, borers, datanas, the bean weevil and the red-humped apple-tree caterpillar.

Since the Legislature placed the work on the gypsy and brown-tail moths in the hands of a special commission, no particular attention has been given them here; but some facts observed in connection with their distribution are here noted, as they have been gathered by members of the station. A few tents of the brown-tail moth were observed in Amherst last spring and others were received from Martha's Vineyard, while several were found on Nantucket last fall, showing that this insect is widely distributed over the State. Several cases have also been reported to the station of the presence

of the gypsy moth outside of the territory originally occupied by it, and these observations have been confirmed by inspectors of the Gypsy Moth Commission. That this insect is now rapidly spreading there can be no doubt, and it is too probable that the entire State will before long be infested by these two insects, which are among the worst enemies to man which occur in the United States.

Compilation of Analyses of Agricultural Chemicals, Refuse Salts, Ashes, Lime Compounds, Refuse Substances, Guanos, Phosphates and Animal Excrements.

H. D. HASKINS.

- 1. Chemicals, refuse salts, etc.
- 2. Ashes, marls, lime compounds, etc.
- 3. Refuse substances.
- 4. Guanos, phosphates, etc.
- 5. Animal excrement, etc.
- 6. Average per cents. of the different ingredients found in the preceding compilation of analyses, calculated to pounds per ton of 2,000 pounds.

1868 to 1905.

This compilation does not include the analyses made of licensed fertilizers. They are to be found in the different bulletins and annual reports of the State inspector of fertilizers from 1873 to 1895, which are contained in the reports of the secretary of the Massachusetts State Board of Agriculture for these years, and in the bulletins of the division of chemistry of the Hatch Experiment Station of the Massachusetts Agricultural College since March, 1895.

No valuation is stated in this compilation, as the basis of valuation changes from year to year.

In the following compilation of analyses of agricultural chemicals, refuse materials, manurial substances, etc., the signification of the star (*) prefixed to the name of the substance is that the compilation is made up of analyses subsequent to the year 1897. It was believed that a compilation made up of more recent analyses would more nearly

represent the present general chemical character of the substances, and would therefore be of more practical value.

It must be understood that the chemical character of many of the refuse substances used for manurial purposes is constantly undergoing changes, due to frequent variations in the parent industry.

As a rule, in all succeeding analyses the essential constituents are determined and stated; blanks do not imply the absence of the non-essentials.

1. Chemicals, Refuse Salts, etc.

Compilation of Analyses of Fruits, Garden Crops and Insecticides.

H. D. HASKINS.

- 1. Analyses of fruits.
- 2. Analyses of garden crops.
- 3. Relative proportions of phosphoric acid, potassium oxide and nitrogen in fruits and garden crops.
- 4. Analyses of insecticides.

The results of chemical analyses of twenty prominent garden crops (green) show the following average composition, expressed in parts per thousand:—

Nitrogen,				4.1
Potassium oxide,				3.9
Phosphoric acid,				1.9

A computation of the results of the above analyses of green garden vegetables shows the following relative proportion of the three essential ingredients of plant food:—

Nitrogen,				2.2
Potassium oxide,				2.0
Phosphoric acid.				1.0

The weight and particular stage of growth of the vegetables when harvested control, under otherwise corresponding conditions, the actual consumption of each of these articles of plant food. Our information regarding these points is still too fragmentary to enable a more detailed statement here beyond relative proportions. It must suffice for the present to call attention to the fact that a liberal manuring within reasonable limits pays, as a rule, better than a scanty one. (C. A. Goessmann.)

Compilation of Analyses of Fodder Articles and Dairy Products, made at Amherst, Mass., 1868–1905.¹

E. B. HOLLAND AND P. H. SMITH.

- A. Composition and Digestibility of Fodder Articles.
 - I. Green fodders.
 - (a) Meadow grasses and millets.
 - (b) Cereal fodders.
 - (c) Legumes.
 - (d) Mixed and miscellaneous.
 - II. Silage.
 - III. Hay and dry, coarse fodders.
 - (a) Meadow grasses and millets.
 - (b) Cereal fodders.
 - (c) Legumes.
 - (d) Straw.
 - (e) Mixed and miscellaneous.
 - IV. Vegetables, fruits, etc.
 - V. Concentrated feeds.
 - (a) Protein.
 - (b) Starchy.
 - (c) Poultry.
 - VI. Dairy products.
- B. FERTILIZER INGREDIENTS OF FODDER ARTICLES. (For classification, see A and C.)
- C. Analyses of Dairy Products.

¹ Part III. of the report of Department of Foods and Feeding.

A. Composition and Digestibility of Fodder Articles.

¹ Many of these analyses were made in earlier years by the Massachusetts State Experiment Station. The percentages of the several ingredients will vary considerably, depending upon the fertility of the soil, and especially upon the stage of growth of the plant. In the majority of cases the number of samples analyzed is too few to give a fair average. The figures, therefore, must be regarded as close approximations, rather than as representing absolutely the exact fertilizing ingredients of the different materials. (J. B. L.)

² Evidently below normal.

COEFFICIENTS OF DIGESTIBILITY OF AMERICAN FEED STUFFS.—EXPERIMENTS MADE IN THE UNITED STATES.¹

J. B. LINDSEY AND P. H. SMITH.

Experiments with Ruminants. Experiments with Swine. Experiments with Horses. Experiments with Poultry. Experiments with Calves.

Complete through Dec. 31, 1905.

¹ Being a portion of the report of the Division of Foods and Feeding.

EXPERIMENTS WITH RUMINANTS.

Literature. — The following publications have been consulted in compiling the foregoing tables of digestibility:—

Colorado Experiment Station, Bulletins 8, 93.

Connecticut (Storrs) Experiment Station, reports for 1894-96, 1898.

Illinois Experiment Station, Bulletins 43, 58.

Kansas Experiment Station, Bulletin 103.

Louisiana Experiment Station, Bulletin 77, second series.

Maine Experiment Station, reports for 1886-91, 1893, 1894, 1897, 1898, 1900; Bulletin 110.

Maryland Experiment Station, Bulletins 20, 41, 43, 51, 77, 86.

Massachusetts, Hatch Experiment Station, reports for 1895–99, 1901–05; Bulletin 50 and unpublished data.

Massachusetts, State Experiment Station, reports for 1893, 1894.

Minnesota Experiment Station, reports for 1894–96; Bulletins 26, 36, 42, 47, 80.

Mississippi Experiment Station, report for 1895.

New York Experiment Station, reports for 1884, 1888, 1889; Bulletin 141.

North Carolina Experiment Station, Bulletins 80c, 81, 87d, 97, 118, 148, 160, 172.

Oklahoma Experiment Station, Bulletins 37, 46.

Oregon Experiment Station, Bulletins 6, 47, 85.

Pennsylvania Experiment Station, reports for 1887–94, 1897, 1898, 1900–01, 1903–04.

Tennessee Experiment Station, unpublished data.

Texas Experiment Station, Bulletins 13, 15, 19.

Utah Experiment Station, Bulletins 16, 54, 58.

United States Department of Agriculture, Bureau of Animal Industry, Bulletin 56.

Wisconsin Experiment Station, report for 1889; Bulletin 3. Wyoming Experiment Station, unpublished data.
